## 4-BIT BISTABLE LATCH

### CONNECTION DIAGRAM PINOUT A

**DESCRIPTION** — The '75 latch is used as temporary storage for binary information between processing units and input/output or indicator units. Information present at a data (D) input is transferred to the Q output when the Enable is HIGH and the Q output will follow the data input as long as the Enable remains HIGH. When the Enable goes LOW, the information (that was present at the data input at the time the transition occurred) is retained at the Q output until the Enable is permitted to go HIGH.

The '75 features complementary Q and  $\bar{Q}$  output from a 4-bit latch and is available in 16-pin packages. For higher component density applications, the '77 4-bit latch is available in the 14-pin package with Q outputs omitted.
