## CA3059

## Zero Voltage Switch

This series is designed for thyristor control in a variety of AC power switching applications for AC input voltages of $24 \mathrm{~V}, 120 \mathrm{~V}$, 208/230 V, and 277 V @ 50/60 Hz.

## Applications:

- Relay Control
- Valve Control
- Heater Control
- Lamp Control
- On-Off Motor Switching
- Differential Comparator with Self-Contained Power Supply for Industrial Applications
- Synchronous Switching of Flashing Lights

NOTES: 1. Care must be taken, especially when using an external power supply, that total package dissipation is not exceeded.
2. The values given in the Electrical Characteristics Table at 120 V also apply for operation at input voltages of $24 \mathrm{~V}, 208 / 230 \mathrm{~V}$, and 277 V , except for Pulse Duration test. However, the series resistor $\left(R_{S}\right)$ must have the indicated value, shown in Table $A$ for the specified input voltage.
3. $\mathrm{I}_{4}$ out of Pin $4,2.0 \mathrm{~V}$ on Pin $1, \mathrm{~S}_{1}$ position 2.

## APPLICATION INFORMATION

## Power Supply

The CA3059 is a self-powered circuit, powered from the AC line through an appropriate dropping resistor (see Table A). The internal supply is designed to power the auxiliary power circuits.

In applications where more output current from the internal supply is required, an external power supply of higher voltage should be used. To use an external power supply, connect Pin 5 and Pin 7 together and apply the synchronizing voltage to Pin 12 and the DC supply voltage to Pin 2 as shown in Figure 4.

## Operation of Protection Circuit

The protection circuit, when connected, will remove current drive from the triac if an open or shorted sensor is detected. This circuit is activated by connecting Pin 13 to Pin 14 (see Figure 1).

The following conditions should be observed when the protection circuit is utilized:
a. The internal supply should be used and the external load current must be limited to 2 mA with a $5 \mathrm{k} \Omega$ dropping resistor.
b. Sensor Resistance $\left(\mathrm{R}_{\mathrm{X}}\right)$ and $\mathrm{R}_{\mathrm{P}}$ values should be between $2 \mathrm{k} \Omega$ and $100 \mathrm{k} \Omega$.
c. The relationship $0.33<\mathrm{R}_{\mathrm{X}} / \mathrm{R}_{\mathrm{P}}<3$ must be met over the anticipated temperature range to prevent undesired activation of the circuit. A shunt or series resistor may have to be added.

## External Inhibit Function

A priority inhibit command applied to Pin 1 will remove current drive from the thyristor. A command of at least $+1.2 \mathrm{~V} @ 10 \mu \mathrm{~A}$ is required. A DTL or TTL logic 1 applied to Pin 1 will activate the inhibit function.

## DC Gate Current Mode

When comparator operation is desired or inductive loads are being switched, Pins 7 and 12 should be connected. This connection disables the zero-crossing detector to permit the flow of gate current from the differential sensing amplifier on demand. Care should be exercised to avoid possible overloading of the internal power supply when operating the device in this mode. A resistor should be inserted between Pin 4 and the thyristor gate in order to limit the current.
