## All Band TV Tuner IC (VHF-CATV-UHF)

## Description

The CXA3025N is a single chip TV tuner IC which performs as a mixer, oscillator for UHF and VHFCATV bands. An IF amplifier is also provided.

This IC adopts a 24 -pin SSOP package ( 0.8 mm pitch) in response to the trend towards miniaturizing the tuner and automatic IC mounting.

## Features

- Low noise figure
- Superior cross modulation
- Low spurious
- Stable oscillating characteristics
- Local oscillator output for PLL
- Double tune filter connectable to MIX output
- Low thermal resistance package

## Structure

Bipolar silicon monolithic IC

Absolute Maximum Ratings $\left(\mathrm{Ta}=25^{\circ} \mathrm{C}\right)$

- Supply voltage Vcc 10.5 V
- Storage temperature Tstg -65 to $+150 \quad{ }^{\circ} \mathrm{C}$
- Allowable power dissipation

Pd 1200 mW
(when mounted on a board)

## Operating Conditions

$\begin{array}{llcr}\text { - Supply voltage } & \text { Vcc } & 9.0 \pm 0.9 & \text { V } \\ \text { - Operating temperature } & \text { Topr } & -20 \text { to }+75 & { }^{\circ} \mathrm{C}\end{array}$

## Applications

- TV tuner
- CATV tuner
- VCR tuner

## Block Diagram and Pin Configuration (Top View)

*1 Measured value for untuned inputs.
*2 Noise figure is the directly-read value of the NF meter in DSB.
*3 Desired signal (fd) input level is -33 dBm . Undesired signal (fud) is $100 \mathrm{kHz}, 30 \% \mathrm{AM}$ at $\pm 12 \mathrm{MHz}$. The measurement value is the undesired signal level, measured with a spectrum analyzer at $\mathrm{S} / \mathrm{I}=46 \mathrm{~dB}$.
*4 Frequency variation from 3 seconds to 3 minutes after switch ON.
${ }^{* 5}$ Frequency variation when $\mathrm{Vcc}=9 \mathrm{~V} \pm 5 \%$ variation.

## Electrical Characteristics Measurement Circuit

## Application Circuit

## Description of Operation (See Electrical Characteristics Measurement Circuit.)

## VHF oscillator circuit

This is a differential amplifier type oscillator circuit with an output at Pin 15 and an input at Pin 13.
Connect an LC resonance circuit comprising a varicap diode to Pin 15 through a coupling capacitor, and input the positive feedback from this resonance circuit to Pin 13 through a feedback capacitor to execute oscillation. Note that if the capacitance across Pins 13 and 15 is too large, positive feedback may be applied via a parasitic capacitance causing undesired stray oscillation. The resistance connected to Pin 13 is for preventing parasitic oscillation, and is inserted to ensure stable oscillation.

## VHF mixer circuit

The mixer circuit adopts a common emitter type double-balanced mixer with little leakage of the local oscillation signal. The RF signal is input to Pins 8 and 9. During normal use, the RF signal is input to one pin while the other pin is connected to GND. The RF signal is converted to IF frequency by the signal supplied from the oscillator and then output to Pins 4 and 5.

## UHF oscillator circuit

The UHF oscillator is formed from two collector-grounded Colpitts oscillators, and oscillation is provided at the differential input through an LC resonance circuit comprising a varicap diode. An LC resonance circuit comprising a varicap diode is connected across Pins 16, 17, 20 and 21.

## UHF mixer circuit

Like the VHF mixer, the UHF mixer adopts a double-balanced mixer. The RF signal is input to Pins 11 and 12. There is a balanced input at the differential from both edges of the secondary coil of the pre-stage double tune circuit, or an unbalanced input to Pin 11 with a capacitor connected at Pin 12 to GND. Otherwise, the conditions and usage are the same as those for the VHF mixer circuit.

## IF amplifier circuit

The signal frequency converted by the mixer is output from Pins 4 and 5 , and input to IF input pins 1 and 2 through an external IF tune circuit. For the IF tune circuit, a single tune circuit like the electrical characteristics measurement circuit or a double tune circuit can be connected. The signal amplified by the IF amplifier is output from Pin 24. The output impedance is approximately $75 \Omega$.
Also, the input block of the IF amplifier has a built-in coupling capacitor, and direct connection with the mixer output is possible.

U/V switch circuit
UHF operation is chosen by applying voltage of 3 V or more to Pin 23 ; VHF operation for 0 V or OPEN.
PLL oscillator signal output circuit
The oscillation signal is output to Pin 22 (PLLOUT) through a buffer amplifier. The resistance connected to the output pin is used to adjust the current flowing to the buffer amplifier. The resistance value is adjusted depending on the connected load, and output distortion can be minimized.

## Notes on Operation

Care should be taken for grounding, etc. when placing external parts as high operating frequencies are present. In addition, since the GND pins (Pins 6, 7, 18 and 19) also serve as heat dissipation pins, care should be taken to prevent heat problems.
Care should also be taken to prevent electrostatic damage to high frequency I/O pins.

## Example of Representative Characteristics
