## CD Digital Signal Processor

## Description

The CXD2510Q is a digital signal processor LSI for CD players and is equipped with the following functions.

- Wide frame jitter margin ( $\pm 28$ frames) due to a builtin 32K RAM
- Bit clock, which strobes the EFM signal, is generated by the digital PLL
- EFM data demodulation
- Enhanced EFM frame sync signal protection
- Refined super strategy-based powerful error correction C1: double correction, C2: quadruple correction
- Quadruple-speed, double-speed and variable pitch playback
- Noise reduction during track jumps
- Auto zero-cross mute
- Subcode demodulation and Sub Q data error correction
- Digital spindle servo (built-in oversampling filter)
- 16-bit traverse counter
- Asymmetry compensation circuit
- Serial bus-based CPU interface
- Error correction monitor signals are output from a new CPU interface.
- Servo auto sequencer
- Fine search which performs high-precision track jumps
- Digital audio interface output
- Digital level meter, peak meter
- Bilingual compatible

## Features

- All digital signals processed with a single chip during playback
- High-integrated mounting possible due to a built-in RAM

## Structure

Silicon gate CMOS IC

## Absolute Maximum Ratings

$\begin{array}{llll}\text { - Supply voltage } & \text { Vdd } & -0.3 \text { to }+7.0 & \mathrm{~V} \\ \text { - Input voltage } & \mathrm{V} \text { I } & -0.3 \text { to }+7.0 & \mathrm{~V}\end{array}$

- Input voltage $\quad(\mathrm{Vss}-0.3 \mathrm{~V}$ to $\mathrm{VdD}+0.3 \mathrm{~V})$
- Output voltage Vo $\quad-0.3$ to +7.0 V
- Storage temperature Tstg -40 to $+125{ }^{\circ} \mathrm{C}$
- Supply voltage difference

$$
\begin{array}{cc}
\text { Vss }-A V s s-0.3 \text { to }+0.3 & V \\
\text { VDD }-A V D D-0.3 \text { to }+0.3 & V
\end{array}
$$

## Recommended Operating Conditions

- Supply voltage VDD* 4.50 to 5.50 V
- Operating temperature Topr -20 to $+75 \quad{ }^{\circ} \mathrm{C}$
* The VDD (min.) for the CXD2510Q varies according to the playback speed and built-in VCO selection. The VDD (min.) is 4.50 V when high speed VCO and quadruple-speed playback are selected (variable pitch off). The VdD (min.) for the CXD2510Q under various conditions are as shown in the following table.

| Playback <br> speed | VdD (min.) [V] |  |
| :--- | :---: | :---: |
|  | VCO high-speed | VCO normal-speed |
| $\times 2^{* 1}$ | 4.50 | - |
| $\times 2$ | 3.40 | - |
| $\times 1$ | 3.40 | 4.00 |
| $\times 1^{* 2}$ | 3.40 | 3.40 |

Dashes indicate that there is no assurance of the processor operating. All values are for variable pitch off.
*1 When the internal operation of the LSI is set to normal-speed playback and the operating clock of the signal processor is doubled, double-speed playback results.
*2 When the internal operation of the LSI is set to double-speed mode and the crystal oscillating frequency is halved in low power consumption mode, normal-speed playback results.

## Input/output Capacitances

- Input capacitance CI
- Output capacitance Co

Note) Measurement conditions

## Block Diagram

Pin Configuration

## Pin Description

| Pin No. | Symbol | 1/0 |  | Description |
| :---: | :---: | :---: | :---: | :---: |
| 1 | FOK | 1 |  | Focus OK input. Used for SENS output and the servo auto sequencer. |
| 2 | FSW | 0 | Z, 0 | Spindle motor output filter switching output. |
| 3 | MON | 0 | 1,0 | Spindle motor on/off control output. |
| 4 | MDP | 0 | $1, Z, 0$ | Spindle motor servo control. |
| 5 | MDS | 0 | 1, Z, 0 | Spindle motor servo control. |
| 6 | LOCK | 0 | 1,0 | GFS is sampled at 460 Hz ; when GFS is high, this pin outputs a high signal. If GFS is low eight consecutive samples, this pin outputs low. |
| 7 | NC | - |  |  |
| 8 | vcoo | 0 | 1, 0 | Analog EFM PLL oscillation circuit output. |
| 9 | VCOI | I |  | Analog EFM PLL oscillation circuit input. flock $=8.6436 \mathrm{MHz}$. |
| 10 | TEST | 1 |  | TEST pin. Normally GND. |
| 11 | PDO | 0 | 1, Z, 0 | Analog EFM PLL charge pump output. |
| 12 | Vss |  |  | GND |
| 13 | TESTO |  | - | TEST output pin. Normally open. |
| 14 | NC |  | - |  |
| 15 | NC |  | - |  |
| 16 | VPCO | 0 | 1, Z, 0 | Variable pitch PLL charge pump output. |
| 17 | VCKI | I |  | Variable pitch clock input from the external VCO. fc center $=16.9344 \mathrm{MHz}$. |
| 18 | FILO | 0 | Analog | Master PLL filter output. |
| 19 | FILI | I |  | Master PLL filter input. |
| 20 | PCO | 0 | 1, Z, 0 | Master PLL charge pump output. |
| 21 | AVss |  |  | Analog GND. |
| 22 | CLTV | I |  | Master VCO control voltage input. |
| 23 | AVdd |  |  | Analog power supply (5V). |
| 24 | RF | I |  | EFM signal input. |
| 25 | BIAS | I |  | Constant current input of the asymmetry circuit. |
| 26 | ASYI | I |  | Asymmetry comparator voltage input. |
| 27 | ASYO | 0 | 1, 0 | EFM full-swing output (low = Vss, high = VDD). |
| 28 | ASYE | I |  | Low: asymmetry circuit off; high: asymmetry circuit on |
| 29 | NC |  | - |  |
| 30 | PSSL | 1 |  | Audio data output mode switching input. Low: serial output; high: parallel output. |
| 31 | WDCK | 0 | 1,0 | D/A interface for 48 -bit slot. Word clock $f=2 \mathrm{Fs}$. |
| 32 | LRCK | 0 | 1, 0 | D/A interface for 48-bit slot. LR clock $\mathrm{f}=\mathrm{Fs}$. |
| 33 | Vdo |  |  | Power supply (5V). |

| Pin No | Symbol | 1/0 |  | Description |
| :---: | :---: | :---: | :---: | :---: |
| 34 | DA16 | 0 | 1, 0 | DA16 (MSB) output when PSSL $=1$. <br> 48-bit slot serial data (two's complement, MSB first) when PSSL $=0$. |
| 35 | DA15 | 0 | 1,0 | DA15 output when PSSL $=1 . \quad 48$-bit slot bit clock when PSSL $=0$. |
| 36 | DA14 | 0 | 1, 0 | DA14 output when PSSL $=1$. <br> 64-bit slot serial data (two's complement, LSB first) when PSSL $=0$. |
| 37 | DA13 | 0 | 1,0 | DA13 output when PSSL $=1 . \quad 64$-bit slot bit clock when $\mathrm{PSSL}=0$. |
| 38 | DA12 | 0 | 1,0 | DA12 output when PSSL $=1 . \quad 64$-bit slot LR clock when PSSL $=0$. |
| 39 | DA11 | O | 1,0 | DA11 output when PSSL $=1 . \quad$ GTOP output when PSSL $=0$. |
| 40 | DA10 | 0 | 1,0 | DA10 output when PSSL $=1 . \quad$ XUGF output when PSSL $=0$. |
| 41 | DA09 | 0 | 1,0 | DA09 output when PSSL $=1 . \quad$ XPLCK output when PSSL $=0$. |
| 42 | DA08 | 0 | 1,0 | DA08 output when PSSL $=1 . \quad$ GFS output when PSSL $=0$. |
| 43 | DA07 | 0 | 1, 0 | DA07 output when PSSL $=1 . \quad$ RFCK output when PSSL $=0$. |
| 44 | DA06 | 0 | 1,0 | DA06 output when PSSL $=1 . \quad \mathrm{C} 2 \mathrm{PO}$ output when $\mathrm{PSSL}=0$. |
| 45 | DA05 | 0 | 1,0 | DA05 output when PSSL $=1 . \quad$ XRAOF output when PSSL $=0$. |
| 46 | DA04 | 0 | 1,0 | DA04 output when PSSL $=1 . \quad \mathrm{MNT3}$ output when PSSL $=0$. |
| 47 | DA03 | 0 | 1,0 | DA03 output when PSSL = 1. MNT2 output when PSSL $=0$. |
| 48 | DA02 | 0 | 1, 0 | DA02 output when PSSL $=1 . \quad$ MNT1 output when PSSL $=0$. |
| 49 | DA01 | 0 | 1,0 | DA01 output when PSSL $=1 . \quad$ MNT0 output when PSSL $=0$. |
| 50 | APTR | 0 | 1,0 | Aperture compensation control output. <br> This pin outputs a high signal when the right channel is used. |
| 51 | APTL | 0 | 1,0 | Aperture compensation control output. <br> This pin outputs a high signal when the left channel is used. |
| 52 | Vss |  |  | GND |
| 53 | XTAI | 1 |  | 16.9344 MHz crystal oscillation circuit input. Also the 33.8688 MHz input. |
| 54 | XTAO | 0 | 1,0 | 16.9344 MHz crystal oscillation circuit output. |
| 55 | XTSL | 1 |  | Crystal selector input. The crystal is low for 16.9344 MHz , and high for 33.8688 MHz . |
| 56 | FSTT | 0 | 1,0 | $2 / 3$ frequency divider output for Pins 53 and 54. This pin does not change with the variable pitch. |
| 57 | FSOF | 0 | 1, 0 | $1 / 4$ frequency divider output for Pins 53 and 54. This pin does not change with the variable pitch. |
| 58 | C16M | 0 | 1,0 | 16.9344 MHz output. This pin changes simultaneously with the variable pitch. |
| 59 | MD2 | 1 |  | Digital-out on/off control. High: on; low: off |
| 60 | DOUT | 0 | 1,0 | Digital-out output. |
| 61 | EMPH | 0 | 1,0 | Outputs a high signal when the playback disc has emphasis, and a low signal when there is no emphasis. |
| 62 | WFCK | 0 | 1,0 | WFCK (write frame clock) output. |
| 63 | SCOR | 0 | 1, 0 | Outputs a high signal when either subcode sync S0 or S1 is detected. |
| 64 | SBSO | 0 | 1, 0 | Sub P to W serial output. |
| 65 | EXCK | 1 |  | SBSO readout clock input. |

| Pin <br> No. | Symbol | I/O |  |  |
| :---: | :--- | :--- | :--- | :--- |
| 66 | SQSO | O | 1,0 | Sub Q 80-bit and PCM peak and level data 16-bit output. |
| 67 | SQCK | I |  | SQSO readout clock input. |
| 68 | MUTE | I |  | High: mute; low: release |
| 69 | SENS | - | $1, Z, 0$ | SENS output to CPU. |
| 70 | XRST | I |  | System reset. Reset when low. |
| 71 | DATA | I |  | Serial data input from CPU. |
| 72 | XLAT | I |  | Latch input from CPU. Serial data is latched at the falling edge. |
| 73 | VDD |  |  | Power supply (5V). |
| 74 | CLOK | I |  | Serial data transfer clock input from CPU. |
| 75 | SEIN | I |  | SENS input from SSP. |
| 76 | CNIN | I |  | Track jump count signal input. |
| 77 | DATO | O | 1,0 | Serial data output to SSP. |
| 78 | XLTO | O | 1,0 | Serial data latch output to SSP. Latched at the falling edge. |
| 79 | CLKO | O | 1,0 | Serial data transfer clock output to SSP. |
| 80 | MIRR | I |  | Mirror signal input. |

## Notes)

- The 64-bit slot is an LSB first, two's complement output, and the 48-bit slot is an MSB first, two's complement output.
- GTOP is used to monitor the frame sync protection status. (High: sync protection window open.)
- XUGF is the negative pulse for the frame sync obtained from the EFM signal. It is the signal before sync protection.
- XPLCK is the inverse of the EFM PLL clock. The PLL is designed so that the falling edge and the EFM signal transition point coincide.
- GFS goes high when the frame sync and the insertion protection timing match.
- RFCK is derived from the crystal accuracy, and has a cycle of $136 \mu$.
- C2PO represents the data error status.
- XRAOF is generated when the 32 K RAM exceeds the $\pm 28 \mathrm{~F}$ jitter margin.

* When \$44 and \$45 are excuted.

## Description of Functions

## §1. CPU Interface and Instructions

## - CPU interface

This interface uses DATA, CLOK, and XLAT to set the modes.
The interface timing chart is shown below.

- Information on each address and the data is provided in Table 1-1.
- The internal registers are initialized by a reset when $\mathrm{XRST}=0$; the initialization data is shown in Table 1-2.

The meaning of the data for each address is explained below.
\$4X commands

| Register name | Data 1 |  |  | Data 2 |  |  | Data 3 |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 4 | Command |  |  | MAX timer value |  |  | Timer range |  |  |  |  |  |
|  | AS3 | AS2 | AS1 | AS0 | MT3 | MT2 | MT1 | MT0 | LSSL | 0 | 0 | 0 |

| Command | AS3 | AS2 | AS1 | AS0 |
| :--- | :---: | :---: | :---: | :---: |
| Cancel | 0 | 0 | 0 | 0 |
| FineSearch | 0 | 1 | 0 | RXF |
| Focus-On | 0 | 1 | 1 | 1 |
| 1 TrackJump | 1 | 0 | 0 | RXF |
| 10 TrackJump | 1 | 0 | 1 | RXF |
| 2N TrackJump | 1 | 1 | 0 | RXF |

RXF $=0$ Forward
RXF = 1 Reverse

- When the FOCUS-ON command (\$47) is canceled, $\$ 02$ is sent and the auto sequence is interrupted.
- When the TRACK JUMP commands ( $\$ 44$ to $\$ 45$, $\$ 48$ to $\$ 4 \mathrm{D}$ ) are canceled, $\$ 25$ is sent and the auto sequence is interrupted.

| Max. timer value |  |  |  | Timer range |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| MT3 | MT2 | MT1 | MT0 | LSSL | 0 | 0 | 0 |
| 23.2 ms | 11.6 ms | 5.8 ms | 2.9 ms | 0 | 0 | 0 | 0 |
| 1.49 s | 0.74 s | 0.37 s | 0.18 s | 1 | 0 | 0 | 0 |

- To invalidate the MAX timer, set the MAX timer value to 0 .

## \$5X commands

| Timer | TR3 | TR2 | TR1 | TR0 |
| :--- | :---: | :---: | :---: | :---: |
| Blind (A, E), Overflow (C, G) | 0.18 ms | 0.09 ms | 0.045 ms | 0.022 ms |

| KICK (F) | 0.72 ms | 0.36 ms | 0.18 ms | 0.09 ms |

## \$7X commands

Auto sequence track jump count setting

| Command | Data 1 |  |  |  | Data 2 |  |  |  | Data 3 |  |  |  | Data 4 |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | D3 | D2 | D1 | D0 | D3 | D2 | D1 | D0 | D3 | D2 | D1 | D0 | D3 | D2 | D1 | D0 |
| Auto sequencer track jump count setting | $2^{15}$ | $2^{14}$ | $2^{13}$ | $2^{12}$ | $2^{11}$ | $2^{10}$ | $2^{9}$ | $2^{8}$ | $2^{7}$ | $2^{6}$ | $2^{5}$ | $2^{4}$ | $2^{3}$ | $2^{2}$ | $2^{1}$ | $2^{0}$ |

This command is used to set N when a 2 N track jump is executed, and the jump count setting when fine search is executed for auto sequence.

- The maximum track count is 65,535 , but note that with 2 N track jumps the maximum track jump count is determined by the mechanical limitations of the optical system.
- When N is from 0 to 15 , the number of 2 N track jumps is counted according to the signals input from the CNIN pin. When $N$ is 16 or over, it is counted according to the signals input from the MIRR pin.

## \$8X commands

| Command | Data 1 |  |  |  | Data 2 |  |  |  |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

| 1 | 1 | 0 | 0 |  |  |
| 1 | 1 | 0 | 1 |  |  |
| 1 | 1 | 1 | 0 |  |  |
| 1 | 1 | 1 | 1 |  |  |

* See mute conditions (1), (2), and (4) to (6) under \$AX commands for other mute conditions.

| Command bit | Sync protection window width | Application |
| :---: | :--- | :--- |
| WSEL $=1$ | $\pm 26$ channel clock* | Anti-rolling is enhanced. |
| WSEL $=0$ | $\pm 6$ channel clock | Sync window protection is enhanced. |

* In normal-speed playback, channel clock $=4.3218 \mathrm{MHz}$.

| Command bit | Processing | Use |
| :--- | :--- | :--- |
| VCOSEL $=0$ | The built-in VCO is set to <br> normal-speed. | Used for normal-speed and double-speed <br> (double correction) playback. |
| VCOSEL $=1$ | The built-in VCO is set to <br> high-speed. | Used for quadruple-speed and double-speed <br> (quadruple correction) playback. |

| Command bit | Function | Use |
| :---: | :--- | :--- |
| ASHS $=0$ | The command transfer rate to SSP is set <br> to normal-speed. | Used for normal-speed and double-speed <br> (double correction) playback. |
| ASHS $=1$ | The command transfer rate to SSP is set <br> to half-speed. | Used for quadruple-speed and double-speed <br> (quadruple correction) playback. |

| Command bit | Function |
| :---: | :--- |
| SOCT $=0$ | Sub Q is output from the SQSO pin. |
| SOCT $=1$ | Each output signal is output from the SQSO pin. Input the readout clock to SQCK. <br> (See the Timing Chart 2-4.) |

## \$9X commands

| Command | Data 1 |  |  |  | Data 2 |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | D3 | D2 | D1 | D0 | D3 | D2 | D1 | D0 |
| Function | DCLV | DSPB | A.SEQ | D.PLL | BiliGL | BiliGL | FLFC | 0 |
| specifications | ON-OFF | ON-OFF | ON-OFF | ON-OFF | MAIN | SUB |  |  |

| Command bit | CLV mode |  | Contents |
| :---: | :---: | :---: | :---: |
| DCLV on/off = 0 | During CLVS mode | FSW = low, MON = high, MDS = Z; MDP = servo control signal, carrier frequency of 230 Hz at $\mathrm{TB}_{\mathrm{B}}=0$, and 460 Hz at $\mathrm{TB}=1$. |  |
|  | During CLVP mode | FSW = Z, MON = high; MDS = speed control signal, carrier frequency of 7.35 kHz ; MDP = phase control signal, carrier frequency of 1.8 kHz . |  |
| DCLV on/off = 1 (FSW, MON not required) | During CLVS and CLVP modes | When DCLV <br> $P W M$ and $M D=1$ | $\begin{aligned} \hline \text { MDS }= & \text { PWM polarity signal, carrier frequency of } \\ & 132 \mathrm{kHz} . \\ M D P= & \text { PWM absolute value output (binary), } \\ & \text { carrier frequency of } 132 \mathrm{kHz} . \end{aligned}$ |
|  |  | When DCLV <br> PWM and MD = 0 | $\begin{aligned} \text { MDS }= & Z \\ \text { MDP }= & \text { ternary PWM output, carrier frequency } \\ & \text { of } 132 \mathrm{kHz} . \end{aligned}$ |

When DCLV on/off = 1 for the Digital CLV servo, the sampling frequency of the internal digital filter switches simultaneously with the CLVP/CLVS switching.
Therefore, the cut-off frequency for the CLVS is $\mathrm{fc}=70 \mathrm{~Hz}$ when $\mathrm{TB}_{\mathrm{B}}=0$, and $\mathrm{fc}=140 \mathrm{~Hz}$ when $\mathrm{TB}_{\mathrm{B}}=1$.

| Command bit | Processing |
| :---: | :--- |
| DSPB $=0$ | Normal-speed playback, C2 error correction quadruple correction, variable pitch possible. |
| DSPB $=1$ | Double-speed playback, C2 error correction double correction, variable pitch prohibited. |

FLFC is normally 0 .

## SENS output

| Microcomputer serial register value (latching not required) | ASEQ = 0 | ASEQ = 1 |
| :---: | :---: | :---: |
| \$0X | Z | SEIN (FZC) |
| \$1X | Z | SEIN (A.S) |
| \$2X | Z | SEIN (T.Z.C) |
| \$3X | Z | SEIN (SSTOP) |
| \$4X | Z | XBUSY |
| \$5X | Z | FOK |
| \$6X | Z | SEIN (Z) |
| \$AX | GFS | GFS |
| \$BX | COMP | COMP |
| \$CX | COUT | COUT |
| \$EX | $\overline{\text { OV64 }}$ | $\overline{\text { OV64 }}$ |
| \$7X, 8X, 9X, DX, FX | Z | 0 |

Description of SENS signals

| SENS output | Meaning |
| :--- | :--- |
| Z | The SENS pin is high impedance. |
| XBUSY | Low while the auto sequencer is in operation, high when operation terminates. |
| FOK | Outputs the same signal as the FOK pin. <br> High for "focus OK". |
| GFS | High when the played back frame sync is obtained with the correct timing. |
| COMP | Measures the number of tracks set with Reg B. High when Reg B is latched, low when the <br> initial Reg B number is input by CNIN. |
| COUT | Measures the number of tracks set with Reg B. High when Reg B is latched, toggles each time <br> the Reg B number is input by CNIN. While $\$ 44$ and \$45 are being executed, toggles with each <br> CNIN 8-count instead of the Reg B number. |
| $\overline{\text { OV64 }}$ | Low when the EFM signal, after passing through the sync detection filter, is lengthened by <br> 64 channel clock pulses or more. |

| Command bit | Meaning |
| :---: | :--- |
| DPLL $=0^{*}$ | RFPLL is analog. PDO, VCOI and VCOO are used. |
| DPLL $=1$ | RFPLL is digital. PDO is impedance. |

* External parts for Pins 18 to 20 are required even when analog PLL is selected.

| Command bit | BiliGL MAIN $=0$ | BiliGL MAIN $=1$ |
| :---: | :---: | :---: |
| BiliGL SUB $=0$ | STEREO | MAIN |
| BiliGL SUB $=1$ | SUB | Mute |

Definition of bilingual capable MAIN, SUB and STEREO:
The left channel input is output to the left and right channels for MAIN.
The right channel input is output to the left and right channels for SUB.
The left and right channel inputs are output to the left and right channels for STEREO.

## \$AX commands

| Command | Data 1 |  |  |  | Data 2 |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | D3 | D2 | D1 | D0 | D3 | D2 | D1 | D0 |
| Audio CTRL | Vari <br> Up | Vari <br> Down | Mute | ATT | PCT1 | PCT2 | 0 | 0 |

| Command bit | Meaning |
| :---: | :--- |
| Mute $=0$ | Mute off if other mute <br> conditions are not set. |
| Mute $=1$ | Mute on. <br> Peak register reset. |

| Command bit | Meaning |
| :---: | :--- |
| ATT $=0$ | Attenuation off. |
| ATT $=1$ | -12 dB |

## Mute conditions

(1) When register A mute $=1$.
(2) When MUTE pin $=1$.
(3) When register 8 D.out mute $=1$ and the Digital out is on (MD2 pin $=1$ ).
(4) When GFS stays low for over 35 ms (at normal speed).
(5) When register 9 BiliGL MAIN $=\mathrm{Sub}=1$.
(6) When register A PCT1 $=1$ and PCT2 $=0$.
(1) to (4) perform zero-cross muting with a 1 ms time limit.

| Command bit |  | Meaning |  | PCM Gain |
| :---: | :---: | :--- | :---: | :--- |
| ECC correction ability |  |  |  |  |
| PCT1 | PCT2 |  |  |  |
| 0 | 0 | Normal mode | $\times 0 \mathrm{~dB}$ | C1: double; C2: quadruple |
| 0 | 1 | Level meter mode | $\times 0 \mathrm{~dB}$ | C1: double; C2: quadruple |
| 1 | 0 | Peak meter mode | Mute | C1: double; C2: double |
| 1 | 1 | Normal mode | $\times 0 \mathrm{~dB}$ | C1: double; C2: double |

Description of level meter mode (see the Timing Chart 1-4.)

- When this LSI is set to this mode, it can possess digital level meter functions.
- When the 96 -bit clock is input to SQCK, 96 bits of data are output to SQSO.

The initial 80 bits of data are Sub Q data (see §2. Subcode Interface). The last 16 bits are LSB first 15 -bit PCM data (absolute values). The final bit is PCM data. However, it is high when generated by the left channel and low when generated by the right channel.

- PCM data is reset and the L/R flag is reversed after one readout.

The maximum value for this status is then measured until the next readout.

Description of peak meter mode (see the Timing Chart 1-5.)

- When the LSI is set to this mode, the maximum PCM data value is detected regardless of if it comes from the left or right channel.

The 96-bit clock must be input to SQCK to read out this data.

- When the 96 -bit clock is input, 96 bits of data are output to SQSO and the LSI internal register is reset. In other words, the PCM maximum value detection register is not reset by the readout.
- To reset the PCM maximum value register, set PCT1 = PCT2 = 0 or set the $\$ A X$ mute.
- The Sub Q absolute time is automatically controlled in this mode.

In other words, after the maximum value is generated, the absolute time for CRC to become OK is retained in the memory. Relative time operates as normal.

- The final bit (L/R flag) of the 96-bit data is normally 0 .
- The pre-value hold and average value interpolation data are fixed to level $(-\infty)$ for this mode.

## \$BX commands

This command sets the traverse monitor count.

| Command | Data 1 |  |  |  | Data 2 |  |  |  | Data 3 |  |  |  |  | Data 4 |  |  |  |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | D3 | D2 | D1 | D0 | D3 | D2 | D1 | D0 | D3 | D2 | D1 | D0 | D3 | D2 | D1 | D0 |  |
| Traverse monitor count <br> setting | $2^{15}$ | $2^{14}$ | $2^{13}$ | $2^{12}$ | $2^{11}$ | $2^{10}$ | $2^{9}$ | $2^{8}$ | $2^{7}$ | $2^{6}$ | $2^{5}$ | $2^{4}$ | $2^{3}$ | $2^{2}$ | $2^{1}$ | $2^{0}$ |  |

- When the set number of tracks are counted during fine search, the sled control for the traverse cycle control goes off.
- The traverse monitor count is set when the traverse status is monitored by the SENS output COMP and COUT.

## \$CX commands

| Command | Data 1 |  |  |  | Data 2 |  |  |  | Explanation |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | D3 | D2 | D1 | D0 | D3 | D2 | D1 | D0 |  |
| Servo coefficient setting | Gain MDP1 | Gain MDPO | $\begin{aligned} & \text { Gain } \\ & \text { MDS1 } \end{aligned}$ | Gain MDS0 | 0 | $\begin{array}{\|c\|} \hline \text { Gain } \\ \text { DCLV0 } \\ \hline \end{array}$ | 0 | 0 | Valid only when DCLV $=1$. |
| CLV CTRL (\$DX) |  |  |  | $\begin{array}{\|l\|} \hline \text { Gain } \\ \text { CLVS } \end{array}$ |  |  |  |  | Valid when DCLV = 1 or 0 . |

The spindle servo gain is externally set when DCLV $=1$.

- CLVS mode gain setting: GCLVS

| Gain <br> MDS1 | Gain <br> MDS0 | Gain <br> CLVS | GCLVS |
| :---: | :---: | :---: | :---: |
| 0 | 0 | 0 | -12 dB |
| 0 | 0 | 1 | -6 dB |
| 0 | 1 | 0 | -6 dB |
| 0 | 1 | 1 | 0 dB |
| 1 | 0 | 0 | 0 dB |
| 1 | 0 | 1 | +6 dB |

Note) When $\operatorname{DCLV}=0$, the CLVS gain is as follows. When Gain CLVS $=0$, GCLVS $=-12 \mathrm{~dB}$.
When Gain CLVS $=1$, GCLVS $=0 \mathrm{~dB}$.

- CLVP mode gain setting: GMDP: GMDS

| Gain <br> MDP1 | Gain <br> MDP0 | GMDP |
| :---: | :---: | :---: |
| 0 | 0 | -6 dB |
| 0 | 1 | 0 dB |
| 1 | 0 | +6 dB |

| Gain <br> MDS1 | Gain <br> MDSO | GMDS |
| :---: | :---: | :---: |
| 0 | 0 | -6 dB |
| 0 | 1 | 0 dB |
| 1 | 0 | +6 dB |

- DCLV overall gain setting: GDCLV

| Gain <br> DCLVO | GDCLV |
| :---: | :---: |
| 0 | 0 dB |
| 1 | +6 dB |

## \$DX commands

| Command | D3 | D2 | D1 | D0 |
| :---: | :---: | :---: | :---: | :---: |
| CLV CTRL | DCLV <br> PWM MD | TB | TP | Gain <br> CLVS |

See the \$CX commands

| Command bit | Explanation (See the Timing Chart 1-6.) |
| :---: | :--- |
| DCLV PWM MD $=1$ | Digital CLV PWM mode specified. Both MDS and MDP are used. |
| DCLV PWM MD $=0$ | Digital CLV PWM mode specified. Ternary MDP values are output. |

| Command bit | Explanation |
| :---: | :--- |
| $\mathrm{TB}=0$ | Bottom hold in CLVS and CLVH modes at a cycle of RFCK/32. |
| $\mathrm{TB}=1$ | Bottom hold in CLVS and CLVH modes at a cycle of RFCK/16. |
| $\mathrm{TP}=0$ | Peak hold in CLVS mode at a cycle of RFCK/4. |
| $\mathrm{TP}=1$ | Peak hold in CLVS mode at a cycle of RFCK/2. |

Note) Peak hold is performed at 34 kHz in CLVH mode.
\$EX commands

| Command | D3 | D2 | D1 | D0 |
| :---: | :---: | :---: | :---: | :---: |
| CLV mode | CM3 | CM2 | CM1 | CM0 |

| CM3 | CM2 | CM1 | CM0 | Mode | Explanation |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 0 | 0 | 0 | 0 | STOP | See the Timing Chart 1-7. |
| 1 | 0 | 0 | 0 | KICK | See the Timing Chart 1-8. |
| 1 | 0 | 1 | 0 | BRAKE | See the Timing Chart 1-9. |
| 1 | 1 | 1 | 0 | CLVS |  |
| 1 | 1 | 0 | 0 | CLVH |  |
| 1 | 1 | 1 | 1 | CLVP |  |
| 0 | 1 | 1 | 0 | CLVA |  |

STOP : Spindle motor stop mode.
KICK : Spindle motor forward rotation mode.
BRAKE : Spindle motor reverse rotation mode.
CLVS : Rough servo mode. When the RF-PLL circuit lock is disengaged, this mode is used to pull the disc rotations within the RF-PLL capture range.
CLVP : PLL servo mode.
CLVA : Automatic CLVS/CLVP switching mode. This mode is normally used during playback.

## §2. Subcode Interface

This section explains the subcode interface.
There are two methods for reading out a subcode externally. The 8 -bit subcodes P to W can be read from SBSO by inputting EXCK.
Sub Q can be read out after the CRC check of the 80 bits of information in the subcode frame.
This is accomplished, after checking SCOR and CRCF, by inputting 80 clock pulses to SQCK and reading data from the SQSO pin.

## §2-1. P to W Subcode Read

Data can be read out by inputting EXCK immediately after WFCK falls. (See the Timing Chart 2-1.)

## §2-2. 80-bit Sub Q read

Fig. 2-2 shows the peripheral block of the 80 -bit Sub $Q$ register.

- First, Sub Q, regenerated at one bit per frame, is input to the 80 -bit serial/parallel register and the CRC check circuit.
- 96 -bit Sub $Q$ is input, and if the CRC is OK, it is output to $\operatorname{SQSO}$ with CRCF $=1$. In addition, the 80 bits are loaded into the parallel/serial register.
When SQSO goes high after SCOR is output, the CPU determines that new data (which passed the CRC check) has been loaded.
- In the CXD2510Q, when 80-bit data is loaded, the order of the MSB and LSB is inverted for each byte. As a result, although the sequence of bytes is the same, the bits within the bytes are now ordered LSB first.
- Once the fact that the 80 -bit data has been loaded is confirmed, SQCK is input so that the data can be read. In this LSI, the SQCK input is detected, and the retriggerable monostable multivibrator is reset during low.
- The retriggerable monostable multivibrator has a time constant from 270 to $400 \mu \mathrm{~s}$. When the duration that SQCK is high is less than this time constant, the monostable multivibrator is kept reset; during this interval, the $\mathrm{S} / \mathrm{P}$ register is not loaded into the $\mathrm{P} / \mathrm{S}$ register.
- While the monostable multivibrator is being reset, data cannot be loaded in the peak detection parallel/serial register or the 80 -bit parallel/serial register.
In other words, while reading out with a clock cycle shorter than the monostable multivibrator time constant, the register will not be rewritten by CRCOK and others.
- In this LSI, the previously mentioned peak detection register can be connected to the shift-in of the 80 -bit P/S register.
Input and output for ring control 1 are shorted in peak meter or level meter mode.
Ring control 2 is shorted in peak meter mode.
This is because the register is reset with each readout in level meter mode, and to prevent readout destruction in peak meter mode.
As a result, the 96 -bit clock must be input in peak meter mode.
- In addition, as previously mentioned, the absolute time after peak is generated is stored in the memory in peak meter mode.
Fig. 2-3 shows the Timing Chart.
- Although a clock is input from the SQCK pin to actually perform these operations, the high and low intervals for this clock should be between 750 ns and $120 \mu \mathrm{~s}$.

## Timing Chart 2-1

Block Diagram 2-2

Timing Chart 2-3

Timing Chart 2-4
Example: \$802 latch

| Signal | Explanation |
| :---: | :--- |
| PER0 to PER7 ${ }^{*}$ | RF jitter amount (used to adjust the focus bias). 8bit binary data in PER0 $=$ LSB, PER7 = MSB. |
| FOK | Focus OK |
| GFS | High when the frame sync and the insertion protection timing match. |
| LOCK | GFS is sampled at 460 Hz ; when GFS is high, this pin outputs a high signal. <br> If GFS is low eight consecutive samples, this pin outputs low. |
| EMPH | Outputs a high signal when the playback disc has emphasis. |

RF jitter amount, PER0 to PER7 is output in binary code. When RF jitter amount is little, value of binary code is small.

## §3. Description of Other Functions

## §3-1. Channel Clock Regeneration by the Digital PLL Circuit

- The channel clock is necessary for demodulating the EFM signal regenerated by the optical system. Assuming T as the channel clock cycle, the EFM signal is modulated in an integer multiple of T from 3 T to 11T. In order to read the information in the EFM signal, this integer value must be read correctly. As a result, T , that is the channel clock, is necessary.
In an actual player, PLL is necessary to regenerate the channel clock because the fluctuation in the spindle rotation alters the width of the EFM signal pulses.

The block diagram of this PLL is shown in Fig. 3-1.
The CXD2510Q has a built-in three-stage PLL.

- The first-stage PLL regenerates the variable pitch. LPF and VCO are necessary as external parts. The minimum variable amount of the pitch is $0.1 \%$. The output of this first-stage PLL is used as a reference for all clocks within the LSI. Input the XTAO output to the VCKI pin when variable pitch is not used.
- The second-stage PLL regenerates a high-frequency clock needed by the third-stage digital PLL.
- The third-stage PLL is a digital PLL that regenerates the actual channel clock, and has a $\pm 150 \mathrm{kHz}$ (normal state) or more capture range.
- The digital PLL has a secondary loop, and is controlled by the primary loop (phase) and the secondary loop (frequency). When FLFC = 1, the secondary loop can be turned off .
- High-frequency components such as 3T and 4T may contain deviations. In such a case, turning the secondary loop off yields better playability.
However, in this case the capture range becomes 50 kHz .

## Block Diagram 3-1

## §3-2. Frame Sync Protection

- In a CD player operating at normal speed, a frame sync is recorded approximately every $136 \mu \mathrm{~s}$ ( 7.35 kHz ). This signal is used as a reference to know which data is the data within a frame. Conversely, if the frame sync cannot be recognized, the data is processed as error data because the data cannot be recognized. As a result, recognizing the frame sync properly is extremely important for improving playability.
- In the CXD2510Q, window protection and forward protection/backward protection have been adopted for frame sync protection. The adoption of these functions achieves very powerful frame sync protection.
There are two window widths: one for cases where a rotational disturbance affects the player and the other for cases where there is no rotational disturbance (WSEL $=0 / 1$ ). In addition, the forward protection counter is fixed to 13 , and the backward protection counter to 3 . In other words, when the frame sync is being played back normally and then cannot be detected due to scratches, a maximum of 13 frames are inserted. If frame sync cannot be detected for 13 frames or more, the window is released and the frame sync is resynchronized.
In addition, immediately after the window is released and the resynchronization is executed, if a proper frame sync cannot be detected within 3 frames, the window is released immediately.

## §3-3. Error correction

- In the CD format, one 8-bit data contains two error correction codes, C1 and C2. For C1 correction, the code is created with 28-byte information and 4-byte C1 parity.
For C2 correction, the code is created with 24-byte information and 4-byte parity.
Both C1 and C2 are Reed Solomon codes with a minimum distance of 5.
- The CXD2510Q uses refined super strategy to achieve double correction for C1 and quadruple correction for C2.
- In addition, to prevent C2 miscorrection, a C1 pointer is attached to data after C1 correction according to the C1 error status, the playback status of the EFM signal, and the operating status of the player.
- The correction status can be monitored outside the LSI.

See the Table 3-2.

- When the C2 pointer is high, the data in question was uncorrectable. Either the pre-value was held or an average value interpolation was made for the data.

| MNT3 | MNT2 | MNT1 | MNT0 | Description |  |
| :---: | :---: | :---: | :---: | :--- | :--- |

## §3-4. DA Interface

- The CXD2510Q has two modes as DA interfaces.
a) 48-bit slot interface

This interface includes 48 cycles of the bit clock within one LRCK cycle, and is MSB first.
When LRCK is high, the data is for the left channel.
b) 64-bit slot interface

This interface includes 64 cycles of the bit clock within one LRCK cycle, and is LSB first.
When LRCK is low, the data is for the left channel.
Timing Chart 3-4
48bit slot Normal-Speed Playback PSSL $=\mathrm{L}$

Timing Chart 3-5

## §3-5. Digital Out

There are three digital out formats: the type 1 format for broadcasting stations, the type 2 form 1 format for home use, and the type 2 form 2 format for the manufacture of software.
The CXD2510Q supports type 2 form 1.
In addition, regarding the clock accuracy of the channel status, level III is set automatically when the crystal clock is used and level II is variable pitch. In addition, Sub Q data which are matched twice in succession after a CRC check are input to the first four bits (bit 0 to 3 ).
DOUT is output when the crystal is 34 MHz , the variable pitch is reset, and DSPB $=1$. Therefore, set MD2 to 0 and turn DOUT off.
bit 0 to 3 -Sub Q control bits that matched twice with CRCOK
Digital Out C bit

Table 3-6.

## §3-6. Servo Auto Sequence

This function performs a series of controls, including auto focus and track jumps. When the auto sequence command is received from the CPU, auto focus, 1 track jump, 2 N track jumps, and fine search are executed automatically.
SSP (servo signal processor LSI) is used in an exclusive manner during the auto sequence execution (when XBUSY = low), so that commands from the CPU are not transferred to the SSP, but can be sent to the CXD2510Q.
In addition, when using the auto sequence, connect the CPU, RF and SSP as shown in Fig. 3-7, and turn the A.SEQ of register 9 on.

When CLOK goes from low to high while XBUSY is low, XBUSY does not become high for a maximum of $100 \mu \mathrm{~s}$ after that point. This is designed to prevent the transfer of erroneous data to the SSP when XBUSY changes from low to high by the monostable multivibrator, which is reset by CLOK being low (when XBUSY is low).

In addition, a MAX timer is built in as a countermeasure against abnormal operation due to external disturbances, etc. When the auto sequence command is sent from the CPU, this command assumes a $\$ 4 X Y$ format, in which $X$ specifies the command and $Y$ sets the MAX timer value and timer range. If the executed auto sequence command does not terminate within the set timer value, the auto sequence is interrupted (like $\$ 40$ ). See $\S 1-2, \$ 4 \mathrm{X}$ commands concerning the timer value and range. Also, the MAX timer is invalidated by inputting \$4X0.
Although this command is explained in the format of $\$ 4 X$ in the following command descriptions, the timer value and timer range are actually sent together from the CPU.
(a) Auto focus (\$47)

Focus search up is performed, FOK and FZC are checked, and the focus servo is turned on.
If $\$ 47$ is received from the CPU, the focus servo is turned on according to Fig. 3-8. The auto focus is executed after focus search up, and the pickup should be lowered beforehand (focus search down). In addition, blind $E$ of register 5 is used to eliminate FZC chattering. In other words, the focus servo is turned on at the falling edge of FZC after FZC has been continuously high for a longer time than E .

## Connection diagram for using the auto sequencer (example)

Fig. 3-7.

Fig. 3-8. (a) Auto Focus Flow Chart

Fig. 3-8. (b) Auto Focus Timing Chart
(b) Track jump

1, 10, and 2 N -track jumps are performed respectively. Always use this when focus, tracking, and sled servo are on. Note that tracking gain up and braking on (\$17) should be sent beforehand because they are not performed.

- 1-track jump

When $\$ 48$ ( $\$ 49$ for REV) is received from the CPU, a FWD (REV) 1-track jump is performed in accordance with Fig. 3-9. Set blind $A$ and brake $B$ with register 5.

- 10-track jump

When $\$ 4 \mathrm{~A}$ ( $\$ 4 \mathrm{~B}$ for REV) is received from the CPU, a FWD (REV) 10-track jump is performed in accordance with Fig. 3-10. The principal difference between the 10-track jump and the 1-track jump is whether to kick the sled or not. In addition, after kicking the actuator, when 5 tracks have been counted through CNIN, the brake is applied to the actuator. Then, when the actuator speed is found to have slowed up enough (determined by the CNIN cycle becoming longer than the overflow $C$ set in register 5), the tracking and sled servos are turned on.

- 2N-track jump

When $\$ 4 C$ ( $\$ 4 D$ for REV) is received from the CPU, a FWD (REV) $2 N$-track jump is performed in accordance with Fig. 3-11. The track jump count " N " is set in register 7. Although N can be set to $2^{16}$ tracks, note that the setting is actually limited by the actuator. CNIN is used for counting the number of jumps when $N$ is less than 16, and MIRR is used when $N$ is 16 or higher.
Although the 2 N -track jump basically follows the same sequence as the 10 -track jump, the one difference is that after the tracking servo is turned on, the sled continues to move only for " D ", set in register 6.

## - Fine search

When \$44 (\$45 for REV) is received from the CPU, a FWD (REV) fine search (N-track jump) is performed in accordance with Fig. 3-12. The one difference from a $2 N$-track jump is that a higher precision is achieved by controlling the traverse speed. The track jump count is set in register $7 . \mathrm{N}$ can be set to $2^{16}$ tracks. After kicking the actuator and sled, the traverse speed is controlled based on the overflow G. Set kick $D$ and $F$ in register 6 and overflow $G$ in register 5 . After $N$ tracks have been counted through CNIN, the brake is applied to the actuator and sled. This is performed by turning the tracking servo for the actuator on, and by kicking the sled in the opposite direction. The cancel command $\$ 40$ is sent from the CPU when track jump is terminated.
Set overflow $G$ to the speed required to slow up just before the track jump terminates. The speed should be such that it will come on-track when the tracking servo turns on at the termination of the track jump. (Set the target track count $\mathrm{N}-\alpha$ for the traverse monitor counter which is set in register B , and COMP will be monitored. When the falling edge of this COMP is detected, overflow G can be reset.)

## §3-7. Digital CLV

Fig. 3-13 shows the block diagram. Digital CLV makes PWM output in CLVS, CLVP and other modes with the MDS error or MDP error signal sampling frequency increased to 130 kHz during normal-speed operation. In addition, the digital spindle servo can set the gain.

Digital CLV

CLVS U/D: Up/down signal from the CLV-S servo.
MDS error: Frequency error for CLV-P servo.
MDP error: Phase error for CLV-P servo.

Fig. 3-13. Block Diagram

## §3-8. Asymmetry Compensation

Fig. 3-14 shows the block diagram and circuit example.

Fig. 3-14. Example of an Asymmetry Compensation Application Circuit

## §3-9. Playback Speed

In the CXD2510Q, the following playback modes can be selected through different combinations of the crystal, XTSL pin, double-speed command (DSPB), VCO selection command (VCOSEL) and command transfer rate selector (ASHS). Also, the minimum operating voltage changes according to the playback mode. (See the Recommended Operating Conditions.)

Playback modes

| Mode | X'tal | XTSL | DSPB | VCOSEL | ASHS | Playback speed | Error correction |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :--- |
| 1 | 768 Fs | 1 | 0 | $0 / 1$ | 0 | $\times 1$ | C1: double; C2: quadruple |
| 2 | 768 Fs | 1 | 1 | $0 / 1$ | 0 | $\times 2$ | C1: double; C2: double |
| 3 | 768 Fs | 0 | 0 | 1 | 1 | $\times 2$ | C1: double; C2: quadruple |
| 4 | 768 Fs | 0 | 1 | 1 | 1 | $\times 4$ | C1: double; C2: double |
| 5 | 384 Fs | 0 | 0 | $0 / 1$ | 0 | $\times 1$ | C1: double; C2: quadruple |
| 6 | 384 Fs | 0 | 1 | $0 / 1$ | 0 | $\times 2$ | C1: double; C2: double |
| 7 | 384 Fs | 1 | 1 | $0 / 1$ | 0 | $\times 1$ | C1: double; C2: double |

However, Fs $=44.1 \mathrm{kHz}$.
