TC74VCXH16374FT

Low-Voltage 16-Bit D-Type Flip-Flop with Bushold

The TC74VCXH16374FT is a high-performance CMOS 16-bit D-type flip-flop. Designed for use in 1.8-V, 2.5-V or 3.3-V systems, it achieves high-speed operation while maintaining the CMOS low power dissipation.

This 16-bit D-type flip-flop is controlled by a clock input (CK) and a output enable input ($\overline{OE}$) which are common to each byte. It can be used as two 8-bit flip-flops or one 16-bit flip-flop. When the $\overline{OE}$ input is high, the outputs are in a high-impedance state.

The D data inputs include active bushold circuitry, eliminating the need for external pull-up resisisors to hold unused or floating data inputs at a valid logic level.

All inputs are equipped with protection circuits against static discharge.
