## DATA SHEET

# TDA3608Q <br> Multiple voltage regulator with switch 

Preliminary specification
File under Integrated Circuits, IC01

## FEATURES

## General

- Two $\mathrm{V}_{\mathrm{P}}$-state controlled regulators (regulator 1 and 3) and a power switch
- Regulator 2 and reset operate during load dump and thermal shutdown
- Separate control pins for switching regulator 1 , regulator 3 and the power switch
- Supply voltage range of -18 to +50 V
- Low reverse current of regulator 2
- Low quiescent current (when regulator 1, regulator 3, and power switch are switched off)
- Hold output (only valid when regulator 1 is switched on)
- Reset and hold outputs (open collector outputs)
- Adjustable reset delay time
- High ripple rejection
- Back-up capacitor for regulator 2.

## Protections

- Reverse polarity safe (down to -18 V without high reverse current)
- Able to withstand voltages up to 18 V at the outputs (supply line may be short-circuited)
- ESD protected on all pins
- Thermal protection
- Load dump protection
- Foldback current limit protection for regulators 1, 2 and 3
- Delayed second current limit protection for the power switch (at short-circuit)
- The regulator outputs and the power switch are $D C$ short-circuited safe to ground and $V_{P}$.

## GENERAL DESCRIPTION

The TDA3608Q is a multiple output voltage regulator with a power switch, intended for use in car radios with or without a microcontroller. It contains:

- Two fixed voltage regulators with a foldback current protection (regulator 1 and regulator 3 ) and one fixed voltage regulator (regulator 2), intended to supply a microcontroller, that also operates during load dump and thermal shutdown.
- A power switch with protections, operated by an enable input
- Reset and hold outputs that can be used to interface by the microcontroller. The reset signal can be used to call up the microcontroller and the hold output indicates regulator 1 voltage available and within range.
- A supply pin which can withstand load dump pulses and negative supply voltages
- Regulator 2 that will be switched on at a back-up voltage higher than 6.5 V and off when the output voltage of regulator 2 drops below 1.9 V
- A provision for use of a reserve supply capacitor that will hold enough energy for regulator 2 ( 5 V continuous) to allow a microcontroller to prepare for loss of voltage.

| BU | 12 | back-up |
| SW | 13 | power switch output |

## FUNCTIONAL DESCRIPTION

The TDA3608Q is a multiple output voltage regulator with a power switch, intended for use in car radios with or without a microcontroller. Because of low-voltage operation of the car radio, low-voltage drop regulators are used in the TDA3608Q.

Regulator 2 will switch on when the back-up voltage exceeds 6.5 V for the first time and will switch off again when the output voltage of regulator 2 drops below 1.9 V (this is far below an engine start). When regulator 2 is switched on and the output voltage of this regulator is within its voltage range, the reset output will be enabled (reset will go HIGH via a pull-up resistor) to generate a reset to the microcontroller. The reset cycles can be extended by an external capacitor at pin 9 . The above mentioned start-up feature is built-in to secure a smooth start-up of the microcontroller at first connection, without uncontrolled switching of regulator 2 during the start-up sequence.

The charge of the back-up capacitor can be used to supply regulator 2 for a short period when the supply falls down to 0 V (time depends on value of storage capacitor). When regulator 2 and the supply voltage ( $\mathrm{V}_{\mathrm{P}}>4.5 \mathrm{~V}$ ) are both available, regulators 1 and 3 can be operated by means of enable inputs (pins 6 and 4 respectively).

Fig. 2 Pin configuration.

Regulator 1 has a hold output (open collector) indicating that the output voltage of this regulator is settled (held HIGH by external pull-up resistor) and when the output voltage of this regulator drops out of regulation (because of supply voltage drop or high load) the hold output will go LOW. The hold output signal is only valid when regulator 1 is enabled by its enable input (pin 6).

The power switch can also be controlled by means of a separate enable input (pin 7) as shown in Fig. 3 for the behaviour of the power switch output.

All output pins are fully protected. The regulators are protected against load dump (regulators 1 and 3 will switch off at supply voltages $>18 \mathrm{~V}$ ) and short-circuit (foldback current protection).

The power switch contains a current protection, but this protection is delayed at short-circuit condition for at least 10 ms . During this time the output current is limited to a peak value of at least 3 A and 2 A continuous ( $\mathrm{V}_{\mathrm{P}} \leq 18 \mathrm{~V}$ ). At supply voltages $>17 \mathrm{~V}$ the power switch is clamped at maximum 16 V (to avoid external connected circuitry being damaged by an overvoltage) and the power switch will switch off at load dump.

The total timing diagram is shown in Fig.3.

$V_{P}$ and enable Schmitt trigger

## Multiple voltage regulator with switch

## Notes

1. Minimum operating voltage, only if $\mathrm{V}_{\mathrm{P}}$ has exceeded 6.5 V .
2. The quiescent current is measured in the standby mode. So, the enable inputs of regulators 1,3 and the switch are grounded and $R_{L(R E G 2)}=\infty$ (see Fig.6).
3. The voltage of the regulator sinks as a result of a $\mathrm{V}_{\mathrm{P}}$ drop.
4. The rise and fall time is measured with a $10 \mathrm{k} \Omega$ pull-up resistor and a 50 pF load capacitor.
5. The delay time depends on the value of the capacitor: $\mathrm{t}_{\mathrm{d}}=\frac{\mathrm{C}}{\mathrm{I}_{\mathrm{ch}}} \times \mathrm{V}_{\mathrm{C}(\mathrm{th})}=\mathrm{C} \times\left(750 \times 10^{3}\right)(\mathrm{ms})$
6. The drop-out voltage of regulators 1,2 and 3 is measured between $V_{P}$ and REGn.
7. At current limit, $\mathrm{I}_{\mathrm{REGmn}}$ is held constant (see Fig. 4 for behaviour of $\mathrm{I}_{\mathrm{REGmn}}$ ).
8. The foldback current protection limits the dissipated power at short-circuit (see Fig.4).
9. The peak current of 300 mA can only be applied for short periods ( $\mathrm{t}<100 \mathrm{~ms}$ ).
10. The drop-out voltage measured between BU and REG2.
11. The drop-out voltage of the power switch is measured between $V_{P}$ and $S W$.
12. The maximum output current of the power switch is limited to 1.8 A when the supply voltage exceeds 18 V .
13. At short-circuit, $\mathrm{I}_{\mathrm{sc}}$ of the power switch is held constant to a lower value than the continuous current after a delay of at least 10 ms (see Fig.5).
14. The reverse current of the back-up switch is measured when flowing out of pin $V_{P}$ with $V_{P}=0 \mathrm{~V}$.

Multiple voltage regulator with switch

## TEST AND APPLICATION INFORMATION

## Test information

(1) Capacitor not required for stability.

Fig. 6 Test circuit.

## Application information

## Noise

The noise on the supply line depends on the value of the supply capacitor and is caused by a current noise (output noise of the regulators is translated into a current noise by means of the output capacitors). Table 1 shows the noise figure with the corresponding output capacitor for each regulator. The noise is minimal when a high frequency capacitor of 220 nF in parallel with an electrolytic capacitor of $100 \mu \mathrm{~F}$ is connected directly to pins $\mathrm{V}_{\mathrm{P}}$ and GND.

Table 1 Noise figures

| REGULATOR | NOISE FIGURE(1) |  |  |
| :---: | :---: | :---: | :---: |
|  | $\mathbf{C}_{\mathbf{O}}=\mathbf{1 0} \boldsymbol{\mu} \mathbf{F}$ | $\mathbf{C}_{\mathbf{O}}=\mathbf{4 7} \mu \mathbf{F}$ | $\mathbf{C}_{\mathbf{O}}=\mathbf{1 0 0} \boldsymbol{\mu} \mathbf{F}$ |
| 1 | $225 \mu \mathrm{~V}$ | $150 \mu \mathrm{~V}$ | $135 \mu \mathrm{~V}$ |
| 2 | $225 \mu \mathrm{~V}$ | $150 \mu \mathrm{~V}$ | $135 \mu \mathrm{~V}$ |
| 3 | $255 \mu \mathrm{~V}$ | $200 \mu \mathrm{~V}$ | $180 \mu \mathrm{~V}$ |

## Note

1. Measured at a bandwidth of 200 kHz .

## Stability

The regulators are made stable with the external connected output capacitors. The output capacitors can be selected using the graphs of Figs 7 and 8.
When an electrolytic capacitor is used, the temperature behaviour of this output capacitor can cause oscillations at low temperature. The next two examples show how an output capacitor value is selected.

## Example 1

The regulator 1 is made stable with an electrolytic output capacitor of $220 \mu \mathrm{~F}$, Equivalent Series Resistance $(E S R)=0.15 \Omega$. At $-30^{\circ} \mathrm{C}$ the capacitor value is
decreased to $73 \mu \mathrm{~F}$ and the ESR is increased to $1.1 \Omega$. The regulator will remain stable at $-30^{\circ} \mathrm{C}$ (see Fig.7).

## Example 2

The regulator 2 is made stable with a $10 \mu \mathrm{~F}$ electrolytic capacitor (ESR = $3 \Omega$ ). At $-30^{\circ} \mathrm{C}$ the capacitor value is decreased to $3 \mu \mathrm{~F}$ and the ESR is increased to $23.1 \Omega$. The regulator will be instable at $-30^{\circ} \mathrm{C}$ (see Fig.8).

## Solution

Use a tantalum capacitor of $10 \mu \mathrm{~F}$ or a larger electrolytic capacitor. The use of tantalum capacitors is recommended to avoid problems with stability at low temperatures.

Fig. 7 Curves for selecting value of output capacitor for regulators 1 and 3 .

## PACKAGE OUTLINE

DBS13P: plastic DIL-bent-SIL power package; 13 leads (lead length 12 mm)

## SOLDERING

## Introduction

There is no soldering method that is ideal for all IC packages. Wave soldering is often preferred when through-hole and surface mounted components are mixed on one printed-circuit board. However, wave soldering is not always suitable for surface mounted ICs, or for printed-circuits with high population densities. In these situations reflow soldering is often used.

This text gives a very brief insight to a complex technology. A more in-depth account of soldering ICs can be found in our "IC Package Databook" (order code 9398652 90011).

## Soldering by dipping or by wave

The maximum permissible temperature of the solder is $260^{\circ} \mathrm{C}$; solder at this temperature must not be in contact with the joint for more than 5 seconds. The total contact time of successive solder waves must not exceed 5 seconds.

The device may be mounted up to the seating plane, but the temperature of the plastic body must not exceed the specified maximum storage temperature ( $\mathrm{T}_{\text {stg max }}$ ). If the printed-circuit board has been pre-heated, forced cooling may be necessary immediately after soldering to keep the temperature within the permissible limit.

## Repairing soldered joints

Apply a low voltage soldering iron (less than 24 V ) to the lead(s) of the package, below the seating plane or not more than 2 mm above it. If the temperature of the soldering iron bit is less than $300^{\circ} \mathrm{C}$ it may remain in contact for up to 10 seconds. If the bit temperature is between 300 and $400^{\circ} \mathrm{C}$, contact may be up to 5 seconds.

## DEFINITIONS

| Data sheet status |  |
| :--- | :--- |
| Objective specification | This data sheet contains target or goal specifications for product development. |
| Preliminary specification | This data sheet contains preliminary data; supplementary data may be published later. |
| Product specification | This data sheet contains final product specifications. |
| Limiting values | Limiting values given are in accordance with the Absolute Maximum Rating System (IEC 134). Stress above one or <br> more of the limiting values may cause permanent damage to the device. These are stress ratings only and operation <br> of the device at these or at any other conditions above those given in the Characteristics sections of the specification <br> is not implied. Exposure to limiting values for extended periods may affect device reliability. |
| Application information |  |
| Where application information is given, it is advisory and does not form part of the specification. |  |

## LIFE SUPPORT APPLICATIONS

These products are not designed for use in life support appliances, devices, or systems where malfunction of these products can reasonably be expected to result in personal injury. Philips customers using or selling these products for use in such applications do so at their own risk and agree to fully indemnify Philips for any damages resulting from such improper use or sale.
