CMOS 8-Bit Microcontroller

TMP87PM53F

The 87PM53 is a One-Time PROM microcontroller with low-power 256 K bits electrically programmable read only memory for the 87CM53 system evaluation. The 87PM53 is pin compatible with the 87CM53. The operations possible with the 87CM53 can be performed by writing programs to PROM. The 87PM53 can write and verify in the same way as the TC571000D using an adaptor socket BM11104 and an EPROM programmer.

OPERATIONAL DESCRIPTION

The following explains the 87PM53 hardware configuration and operation. The configuration and functions of the 87PM53 are the same as those of the 87CM53, except in that a one-time PROM is used instead of an on-chip mask ROM.

The 87PM53 is placed in the *single-clock* mode during reset. To use the dual-clock mode, the low-frequency oscillator should be turned on by executing [SET (SYSCR2). XTEN] instruction at the beginning of the program.

1. OPERATING MODE

The 87PM53 has two modes: MCU and PROM.

1.1 MCU Mode

The MCU mode is activated by fixing the TEST / VPP pin at low level.

In the MCU mode, operation is the same as with the 87CM53 (the TEST / VPP pin cannot be used open because it has no built-in pull-down resistance).

1.1.1 Program Memory

The 87PM53 has a 32K × 8-bit (addresses 8000_H-$FFFF_H$ in the MCU mode, addresses 18000_H-$1FFFF_H$ in the PROM mode) of program memory (OTP).

When the 87PM53 is used as a system evaluation of the 87CM53, the data is written to the program storage area shown in Figure 1-1.

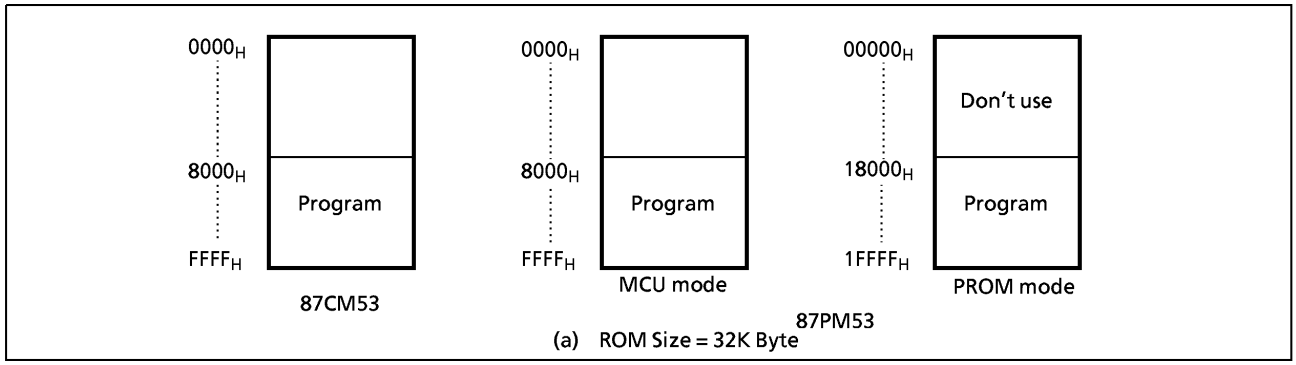

Figure 1.1 Program Memory Area

Note : Either write the data FF_H to the unused area or set the PROM programmer to access only the program storage area.

Note: The absolute maximum ratings are rated values which must not be exceeded during operation, even for an instant. Any one of the ratings must not be exceeded. If any absolute maximum rating is exceeded, a device may break down or its performance may be degraded, causing it to catch fire or explode resulting in injury to the user. Thus, when designing products which include this device, ensure that no absolute maximum rating value will ever be exceeded.

If the device is used under operating conditions other than the recommended operating conditions (supply voltage, operating temperature range, specified AC/DC values etc.), malfunction may occur. Thus, when designing products which include this device, ensure that the recommended operating conditions for the device are always adhered to.

Note 2: Clock frequency fc: The supply voltage ranse of the conditions shows the value in NORMAL1, 2 modes and·IDLE 1,2 modes.

Note 3: When the A/D converter is used, VDD must be set to ≧ 2.7 V.
