## Features

- FM Double-conversion System
- Integrated Second IF Filter with Software-controlled Bandwidth
- Completely Integrated FM Demodulator
- Soft Mute and Multipath Noise Cancellation
- Receiving Condition Analyzer
- AM Up/Down-conversion System
- AM Preamplifier with AGC and Stereo Capability
- 3-wire Bus Controlled
- Search Stop Signal Generation for AM and FM
- Automatic Alignment Possible

Electrostatic sensitive device. Observe precautions for handling.

## Description

The U4255BM-M is a highly integrated AM/FM front-end circuit manufactured using Atmel's advanced BICMOS technology. It represents a complete, automatically adjustable AM/FM front end, containing a double-conversion system for FM and an up/down-conversion receiver for AM with IF1 $=10.7 \mathrm{MHz}$ and IF2 $=450 \mathrm{kHz}$. The front end is suitable for digital or analog AF-signal processing. Together with the PLL U4256BM, an automatically aligned high-performance AM/FM tuner can be built. These ICs are dedicated for highly sophisticated car radio applications.

Preliminary

## Pin Configuration

Figure 2. Block Diagram

## Functional Description

Reception Mode

The U4255BM-M implements an AM up/down-conversion reception path from the RF input signal to the AM-demodulated audio frequency output signal, and for FM reception a double-conversion reception path from the RF input signal to the FM-demodulated multiplex signal (MPX). A VCO and an LO prescaler for AM are integrated to generate the LO frequency for the $1^{\text {st }}$ mixer. Automatic gain control (AGC) circuits are implemented to control the preamplifier and IF stages in the AM and FM reception path.
For improved FM performance, an integrated IF filter with adjustable bandwidth, a softmute feature and an automatic multipath noise cancellation (MNC) circuit are fully integrated. A powerful set of sensors is provided for receiving condition analysis and stop signal generation.
Several register bits (Bit 0 to Bit 93) are used to control circuit operation and to adapt certain circuit parameters to the specific application. The control bits are organized in two 8 -bit and three 24 -bit registers that can be programmed by the 3 -wire bus protocol. The bus protocol and the bit-to-register mapping is described in the section ' 3 -wire Bus Description'. The meaning of the control bits is mentioned in the following sections.

The IC can be operated in four different modes. Mode AM, FM, WB, Standby are selected by means of Bit 92 and Bit 93 according to Table 1.

In AM mode the AM mixer, the AM RF-AGC and the $1^{\text {st }}$ IF AM amplifier at Pin 33 are activated. The input of the $2^{\text {nd }}$ IF amplifier is connected to Pin 28 and the output of the $2^{\text {nd }}$ IF amplifier is fed to the AM demodulator. The output of the AM demodulator is available at MPX output Pin 11.

In FM mode the FM mixer, the FM RF-AGC and the $1^{\text {st }}$ IF FM amplifier at Pin 38 are activated. The bandwidth of the output tank at Pin 23, Pin 24 is increased and the input of the $2^{\text {nd }}$ IF amplifier can be switched between Pin 23, Pin 24 and Pin 28. The output of the $2^{\text {nd }}$ IF amplifier is fed to the integrated bandfilter and FM demodulator. The output of the FM demodulator is available at MPX output Pin 11.

WB mode is similar to FM mode but the input of the $2^{\text {nd }}$ IF amplifier is fixed to Pin 28 , the range of the bandwidth control of the integrated band filter is shifted to lower bandwidth and the gain of the FM demodulator is increased.

In standby mode the mixers, IF amplifiers and AGC circuits are deactivated to reduce current consumption.
Table 1. Operating Mode

| AM/FM/Weather Channel | Bit 93 | Bit 92 |
| :---: | :---: | :---: |
| Standby | 0 | 0 |
| FM | 0 | 1 |
| AM | 1 | 0 |
| Weather band | 1 | 1 |

## Test Mode

## VCO

FM RF-AGC

A special test mode is implemented for final production test only. This mode is activated by setting Bit $9=1$. This mode is not intended to be used in customer application. For normal operation, Bit 9 has to be set to 0 . Bit 18 to Bit 30 are deactivated in normal operation mode.
Table 2. Test Mode

| Mode | Bit 9 |
| :---: | :---: |
| Normal operation | 0 |
| Testmode | 1 |

An oscillator circuit is implemented to build a VCO as proposed in the application schematic. The VCO frequency is used to generate the LO frequency of the $1^{\text {st }}$ mixer stages. The control voltage of the VCO is usually generated by the PLL circuit U4256BM. The VCO signal is provided at the buffered output Pin 16 to be fed to the PLL circuit.

The FM RF-AGC circuit includes a wideband level detector at the input Pin 1 of the FM mixer and an in-band level detector at the output of the FM IF amplifier (Pin 30). The outputs of these level detectors are used to control the current into the pin diode (see Figure 3) in order to limit the signal level at the FM mixer input and the following stages. The maximum pin diode current is determined by R115 and the time constant of the AGC control loop can be adjusted by changing the value of C111.

The AGC threshold level at the input of the FM mixer can be adjusted by Bit 64 and Bit 65 according to Table 3. The in-band AGC threshold referred to the FM mixer input (Pin 1, Pin 2) depends on the gain of the FM IF amplifier and can be adjusted by Bit 89 to Bit 91 .

Table 3. FM-AGC Threshold

| FM-AGC Threshold | Bit 65 | Bit 64 |
| :---: | :---: | :---: |
| $104 \mathrm{~dB} \mu \mathrm{~V}$ | 0 | 0 |
| $101 \mathrm{~dB} \mu \mathrm{~V}$ | 0 | 1 |
| $98 \mathrm{~dB} \mu \mathrm{~V}$ | 1 | 0 |
| $92 \mathrm{~dB} \mu \mathrm{~V}$ | 1 | 1 |

Figure 3. FM RF-AGC Bit 92

## AM RF-AGC

FM $1^{\text {st }}$ Mixer

## AM 1 ${ }^{\text {st }}$ Mixer

The AM RF-AGC controls the current into the AM pin diodes (Pin 7) and the source drain voltage of the MOSFET in the AM preamplifier stage (Pin 6) to limit the level at the AM mixer input (Pin 3, Pin 41). This threshold level can be set by Bit 62 and Bit 63 . If the level at the AM mixer input exceeds the selected threshold, the current into the AM pin diodes is increased. If this step is not sufficient, the source drain voltage of the MOSFET is decreased. The time constant of the AGC control loop can be adjusted by changing the value of the capacitor at Pin 8.
Table 4. AM-AGC Threshold

| AM-AGC Threshold | Bit 63 | Bit 62 |
| :---: | :---: | :---: |
| $99 \mathrm{~dB} \mathrm{\mu V}$ | 0 | 0 |
| $102 \mathrm{~dB} \mathrm{\mu} \mathrm{~V}$ | 0 | 1 |
| $104 \mathrm{~dB} \mu \mathrm{~V}$ | 1 | 0 |
| $105 \mathrm{~dB} \mu \mathrm{~V}$ | 1 | 1 |

In the $1^{\text {st }} \mathrm{FM}$ mixer stage, the FM reception frequency is down converted to the $1^{\text {st }} \mathrm{IF}$ frequency. The VCO frequency is used as LO frequency for the mixer.

The AM $1^{\text {st }}$ mixer is used for up-conversion of the AM reception frequency to the $1^{\text {st }} \mathrm{IF}$ frequency. Therefore, an AM prescaler is implemented to generate the necessary LO frequency from the VCO frequency. The divide factor of the AM prescaler can be selected according to Table 5.

Table 5. Divide Factor of the AM Prescaler

| Divider AM Prescaler | Bit 93 | Bit 92 | Bit 84 | Bit 83 | Bit 82 | Bit 81 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Divide by 10 | 1 | 0 | x | 0 | 0 | 0 |
| Divide by 6 | 1 | 0 | x | 0 | 0 | 1 |
| Divide by 7 | 1 | 0 | x | 0 | 1 | 0 |
| Divide by 8 | 1 | 0 | x | 1 | 0 | 0 |
| Divide by 4 | 1 | 0 | x | 1 | 0 | 1 |

FM $1^{\text {st }}$ IF Amplifier

AM $1^{\text {st }}$ IF Amplifier
$2^{n d}$ Mixer

A programmable gain amplifier is used in FM and WB mode between Pin 38 and Pin 30 to compensate the loss in the external ceramic band filters. The gain of this amplifier is adjusted by Bit 89 to Bit 91 . The input and the output resistance is $330 \Omega$ and fits to external ceramic filters.

Two different temperature coefficients of the FM IF amplifier can be selected by Bit 66 .
Table 6. Gain of the FM IF Amplifier

| Gain FM IF | Bit 91 | Bit 90 | Bit 89 |
| :---: | :---: | :---: | :---: |
| 20 dB | 0 | 0 | 0 |
| 22 dB | 0 | 0 | 1 |
| 24 dB | 0 | 1 | 0 |
| 26 dB | 0 | 1 | 1 |
| 28 dB | 1 | 0 | 0 |
| 29 dB | 1 | 0 | 1 |
| 30 dB | 1 | 1 | 0 |
| 31 dB | 1 | 1 | 1 |

Table 7. Temperature Coefficient Setting of FM IF Amplifier

| Temperature Coefficient (TC) of the IF Amplifier | Bit 66 |
| :---: | :---: |
| $\mathrm{TK}_{\min }$ | 0 |
| $\mathrm{TK}_{\max }$ | 1 |

In AM mode, the gain of the $1^{\text {st }}$ IF amplifier is controlled by the IF-AGC to extend the control range of the IF-AGC.

The $2^{\text {nd }}$ mixer is used in AM, FM and WB mode. The mixer input has $330 \Omega$ input resistance and can be connected directly to an external ceramic filter.

In FM mode, the high output resistance of the second mixer is reduced to increase the bandwidth of the tank at the mixer output. The output resistance can be selected by Bit 60 and Bit 61.
Table 8. $2^{\text {nd }}$ Mixer Output Resistance in FM Mode

| Bit 61 | Bit 60 | Output Resistance (Bit 54 = 0) | Output Resistance (Bit 54 = 1) |
| :---: | :---: | :---: | :---: |
| 0 | 0 | $3.3 \mathrm{k} \Omega$ | $\sim 100 \mathrm{k} \Omega$ |
| 0 | 1 | $0.63 \mathrm{k} \Omega$ | $0.78 \mathrm{k} \Omega$ |
| 1 | 0 | $0.47 \mathrm{k} \Omega$ | $0.55 \mathrm{k} \Omega$ |
| 1 | 1 | $0.29 \mathrm{k} \Omega$ | $0.32 \mathrm{k} \Omega$ |

The LO frequency of the $2^{\text {nd }}$ mixer ( 10.25 MHz ) has to be applied at Pin 22. This signal is usually generated by the PLL circuit U4256BM.

Table 9. FM Bandwidth Mixer 2

| Bit 61 | Bit 60 | FM BW Mixer 2 |
| :---: | :---: | :---: |
| 0 | 0 | 150 kHz |
| 0 | 1 | 200 kHz |
| 1 | 0 | 250 kHz |
| 1 | 1 | 450 kHz |

Remark: The bandwidth is also depending from the values of the application circuit.

## $2^{\text {nd }}$ IF Amplifier

IF-AGC
In AM and WB mode, the input of the second IF amplifier is Pin 28, which is externally connected to the $2^{\text {nd }}$ mixer tank through the AM ceramic filter to achieve channel selectivity. During normal FM operation (Bit $54=0$ ), the input of the second IF amplifier is connected to the $2^{\text {nd }}$ mixer output (Pin 23, Pin 24) and the integrated FM band filter is used for channel selectivity only. It is possible to use an additional external filter between the $2^{\text {nd }}$ mixer tank and Pin 28 in FM mode by setting Bit 54 to 1 .
Table 10. $2^{\text {nd }}$ IF Filter in FM Mode

| 2nd IF Filter | Bit 54 |
| :---: | :---: |
| Internal filter | 0 |
| External and internal filter | 1 |

The IF-AGC controls the level of the $2^{\text {nd }}$ IF signal that is passed to the AM demodulator input or the integrated FM bandfilter and to the $2^{\text {nd }} \mathrm{IF}$ output Pin 20.

Two different time constants of the IF-AGC can be selected by the capacitors at Pin 35 (IFAGCH) and Pin 36 (IFAGCL). The short time constant (IFAGCL) is used in FM mode and in AM search mode. The long time constant (IFAGCH) is used for AM reception.
Table 11. IF-AGC Time Constant

| Mode | Bit 92 | Bit 88 | IF AGC Time Constant |
| :---: | :---: | :---: | :---: |
| FM/WB | 1 | $X$ | IFAGCL (fast) |
| AM reception | 0 | 0 | IFAGCH (slow) |
| AM search | 0 | 1 | IFAGCL (fast) |

In FM/WB mode, the output signal of the FM demodulator is applied to Pin 35 via a series resistor of about $95 \mathrm{k} \Omega$. This low-pass filtered output signal of the FM demodulator is used for the FM demodulator fine adjustment, for muting and as a reference for the deviation sensor.

The $2^{\text {nd }} \mathrm{IF}$ after the gain-controlled $2^{\text {nd }} \mathrm{IF}$ amplifier is available at Pin20 (Bit $55=0$ ). In AM mode, this signal may be used for an external AM stereo decoder. Alternatively, a signal corresponding to the logarithmic field strength after the integrated FM band filter, which is used for multipath detection, can be switched to Pin 20 by setting Bit $55=1$.

Table 12. Pin 20 Output Setting

| Pin 20 | Bit 55 |
| :---: | :---: |
| $2^{\text {nd }} \mathrm{IF}$ output | 0 |
| Multipath field strength | 1 |

Automatic IF Center Frequency Adjustment

Integrated active filters are used in the FM band filter, FM demodulator and adjacent channel sensor. The center frequency of these filters is automatically adjusted to the second IF frequency of 450 kHz . The frequency of 10.25 MHz at Pin 22 is used as a reference for this alignment.

Figure 4. Automatic IF Center Frequency Adjustment

For fine tuning, the center frequency of all these integrated active filters (band filter, demodulator and adjacent channel sensor) can be shifted in steps of 6.25 kHz by means of Bit 56 to Bit 59. Additionally, the center frequency of the band filter can be adjusted separately by means of Bit 14 to Bit 17 if Bit 4 is set to 1 . If Bit 4 is set to 0 , the default setting is used.

Table 13. $2^{\text {nd }}$ IF Center Frequency

| IF Center | Bit 59 | Bit 58 | Bit 57 | Bit 56 |
| :---: | :---: | :---: | :---: | :---: |
| 450.00 kHz | 0 | 0 | 0 | 0 |
| 456.25 kHz | 0 | 0 | 0 | 1 |

Integrated FM Band Filter For FM reception a band filter with variable bandwidth is integrated in front of the demodulator to provide channel selectivity on the $2^{\text {nd }} \mathrm{IF}$. The bandwidth of this filter can be adjusted by Bit 0 to 3 (see Table 15) to be suitable for the present receiving condition. In WB mode, the bandwidth of the integrated filter is shifted to lower bandwidth values, while the necessary channel selectivity is achieved by an external ceramic filter.
The center frequency of the integrated FM band filter can be adjusted by means of Bit 14 to 17 (Bit 4 set to 1). The field strength after the integrated FM band filter that is available at $\operatorname{Pin} 20(\operatorname{Bit} 55=1)$ can be used for this purpose.
Table 15. Bandwidth of the Integrated FM Band Filter.

| IF Bandwidth | Bit 3 | Bit 2 | Bit 1 | Bit 0 |
| :---: | :---: | :---: | :---: | :---: |
| 200 kHz | 0 | 0 | 0 | 0 |
| 190 kHz | 0 | 0 | 0 | 1 |
| 180 kHz | 0 | 0 | 1 | 0 |
| 170 kHz | 0 | 0 | 1 | 1 |
| 160 kHz | 0 | 1 | 0 | 0 |
| 150 kHz | 0 | 1 | 0 | 1 |

| 90 kHz | 1 | 0 | 1 | 1 |
| 80 kHz | 1 | 1 | 0 | 0 |
| 70 kHz | 1 | 1 | 0 | 1 |
| 60 kHz | 1 | 1 | 1 | 0 |
| 50 kHz | 1 | 1 | 1 | 1 |

For weather band reception, the gain of the FM demodulator is increased and can be adjusted by means of Bit 71, Bit 72 in order to increase the output voltage to compensate the low frequency deviation in weather band.
An integrated demodulator fine adjustment allows automatic fine tuning of the demodulator center frequency to the average frequency of the received signal. This feature is implemented for use in weather band mode and can be activated by setting Bit 53 to 0 .

Figure 5. FM Demodulator Automatic Fine Tuning

The center frequency of the FM demodulator can be adjusted by means of Bit 56 to 59. At the center frequency, the DC voltage at the MPX output Pin 11 is equal to the MPX offset voltage that can be measured at Pin 11 while MPX mute is active (Bit $7=1$ ). This adjustment will affect the center frequency of all integrated filters as mentioned before.
Table 16. Demodulator Gain in Weather Band Mode

| Demodulator Gain in Weather Band Mode Relative to FM Mode | Bit 72 | Bit 71 |
| :---: | :---: | :---: |
| 12 dB | 0 | 0 |
| 15 dB | 0 | 1 |
| 18 dB | 1 | 0 |
| 21 dB | 1 | 1 |

Table 17. Demodulator Fine Adjustment

| Demodulator Fine Adjustment | Bit 53 |
| :---: | :---: |
| Fine tuning ON | 0 |
| Fine tuning OFF | 1 |

The soft mute functionality is implemented to reduce the output level of the FM demodulator at low input signal levels to limit the noise at MPX output in this case. If the input level falls below an adjustable threshold, continuously the output of the FM demodulator is continuously muted with decreasing input level until a maximum mute value is reached. The threshold for the start of soft mute and the maximum mute can be adjusted. The signal level for 3 dB mute can be set by means of Bit 68 to 70 and the maximum value for soft mute can be selected by Bit 67. The steepness and the time constant of the soft mute can be adjusted by the resistor and capacitor between Pin 34 and Pin 29.

The field strength signal available at Pin 9 is used for soft mute. Therefore, the soft mute threshold referred to the input of the FM mixer depends on the gain from FM mixer input to the field strength sensor.
Table 18. Soft Mute Threshold

| Relative Soft Mute Threshold | Bit 70 | Bit 69 | Bit 68 |
| :---: | :---: | :---: | :---: |
| Soft mute OFF | 0 | 0 | 0 |
| -18 dB | 0 | 0 | 1 |
| -15 dB | 0 | 1 | 0 |

| 24 dB | 1 |

Figure 6. Soft Mute

## MPX Output

## Receiving Condition Analyzer

Field Strength Sensor

## Search Stop Detector

The output of the AM demodulator (AM mode) or the output of the FM demodulator (FM/WB mode) are available at the MPX output (Pin 11).
The MPX output signal can be muted by setting Bit 7 to 1 .
The bandwidth of the lowpass filter at the MPX output can be set by means of Bit 79 to 90 kHz or 180 kHz .

Table 20. MPX Output Mute

| MPX Output | Bit 7 |
| :---: | :---: |
| MPX out, Pin 11 normal operation | 0 |
| Mute ON | 1 |

Table 21. MPX Output Bandwidth

| Bandwidth MPX Lowpass Filter | Bit 79 |
| :---: | :---: |
| 90 kHz | 0 |
| 180 kHz | 1 |

The U4255BM-M implements several sensors that provide information about the receiving condition of the selected station.

The field strength sensor provides a DC voltage at Pin 9 which represents the logarithmic field strength of the signal in the reception band.
The field strength information can be retrieved either from a level detector at the input of the $2^{\text {nd }}$ mixer (Pin 26) or from the IF-AGC depending on the setting of Bit 80 . The bandwidth of the field strength detection in the AGC is smaller than by using the level detector because of additional selectivity between the $2^{\text {nd }}$ mixer and the $2^{\text {nd }} \mathrm{IF}$ amplifier particularly in AM and WB, but the field strength detection in the AGC is limited to the IF AGC range. Usually the field strength from the level detector is used in FM mode and the AGC field strength is used in AM mode.
Table 22. Field Strength Selection

| Field Strength Narrow Band/ Wide Band | Bit 80 |
| :---: | :---: |
| Fieldstrength at Pin 26 (wide band) | 0 |
| Fieldstrength from IF-AGC (narrow band) | 1 |

A search stop detector is available in AM and FM/WB mode. A STOP condition is signaled if the frequency of the ZF signal is within a window around the center frequency of 450 kHz . The width of this search stop window can be set by Bit 85 to 87 in the range of 0.5 kHz to 80 kHz . The frequency of the ZF signal is measured by counting the number of periods of the ZF signal during a measurement time which is determined by Bit 73 to 78. The inverted STOP signal is available at Pin 21 according to Table 25. The frequency of 10.25 MHz at Pin 22 is used as time reference.

Table 23. Search Stop Detector Measurement Time

| Time Window for Stop Signal | Bit 78 | Bit 77 | Bit 76 | Bit 75 | Bit 74 | Bit 73 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $1 \times 3.1969 \mathrm{~ms}$ | 0 | 0 | 0 | 0 | 0 | 1 |
| $\ldots .$. |  |  |  |  |  |  |

Table 25. Signals Available at Digital Output Pin 21

| Bit 88 | Bit 92 | INT (Pin 21) |
| :---: | :---: | :---: |
| 0 | $0(\mathrm{AM})$ | 1 |
| 0 | $1(\mathrm{FM} / \mathrm{WB})$ | NOT MPINT |
| 1 | $0(\mathrm{AM})$ | NOT STOP |
| 1 | $1(\mathrm{FM} / \mathrm{WB})$ | NOT (STOP AND NOT MPINT) |

[^0]The deviation sensor is active in AM and FM/WB mode and measures the modulation of the signal. It is implemented as a peak detector of the lowpass-filtered MPX signal (see Figure 7). The output voltage at Pin 31 is proportional to the frequency deviation in FM/WB or the modulation depth in AM respectively.

Figure 7. Deviation Sensor

Adjacent Channel Sensor

The adjacent channel sensor is active in FM mode only and measures the field strength outside the reception band. By setting the center frequency of the band filter of the adjacent channel sensor below or above the $2^{\text {nd }}$ IF frequency (Bit 5, Bit 6), it can be determined whether the disturbance signal is located above or below the reception frequency (see Table 28). The bandwidth of the band filter used in the adjacent channel sensor can be changed by means of Bit 10 to 13. If Bit $4=0$ the default bandwidth setting is used. The output of the adjacent channel sensor is independent of the bandwidth setting of the integrated FM band filter.

| above | low | high | high |

## Multipath Sensor

The multipath sensor is active in FM mode only and measures the disturbance due to multipath reception. The multipath sensor detects drops in the field strength after the integrated band filter by calculating the difference between an averaged maximum field strength and the current field strength. The maximum depth of these drops is represented by the voltage of the peak detector at Pin 40 (MULTIP). The level of this voltage represents the degree of disturbance in the received signal.

Figure 9. Multipath Sensor

A Multipath Noise Canceller (MNC) is implemented to reduce disturbance of the received signal in multipath reception conditions. If the difference between the momentary and the averaged field strength falls below a threshold adjustable by Bit 81 to 84 (see Table 30), the MPX signal may be muted and this situation (MPINT) can be signalized at Pin 21 (INT) according to Table 25. Muting of the MPX signal during multipath disturbances can be activated be setting Bit 8.

## 3-wire Bus Description

The register settings of U4255BM-M are programmed by a 3-wire bus protocol. The bus protocol consists of separate commands. A defined number of bits is transmitted sequentially during each command.

One command is used to program all bits of one register. The different registers available (see Table 31) are addressed by the length of the command (number of transmitted bits) and by three address bits that are unique for each register of a given length. 8-bit registers are programmed by 8-bit commands and 24-bit registers are programmed by 24-bit commands.

Each bus command starts with a rising edge on the enable line (EN) and ends with a falling edge on EN. EN has to be kept HIGH during the bus command.

The sequence of transmitted bits during one command starts with the LSB of the first byte and ends with the MSB of the last byte of the register addressed. The DATA is evaluated at the rising edges of CLK. The number of LOW to HIGH transitions on CLK during the HIGH period of EN is used to determine the length of the command.
The bus protocol and the register addressing of U4255BM-M are compatible to the addressing used in U4256BM. That means U4255BM-M and U4256BM can be operated on the same 3-wire bus as shown in the application circuit.

## Diagrams

Figure 12. FM Demodulator
Integrated bandfilter BW setting: 120 kHz , Bits 0 to $2=0$, Bit $3=1$; 1 kHz modulation frequency; $50 \mu \mathrm{~s}$ de-emphasis (THD)

Figure 13. Multipath Sensor
AM modulation frequency 20 kHz ; generator level $40 \mathrm{~dB} \mu \mathrm{~V}$

Figure 14. Multipath Sensor Frequency Response
Generator level $40 \mathrm{~dB} \mu \mathrm{~V}$

Figure 15. Deviation Sensor
FM modulation frequency: $1 \mathrm{kHz} ; \mathrm{BW}$ setting $2^{\text {nd }} \mathrm{IF}$ filter $=120 \mathrm{kHz}$

Figure 16. Deviation Sensor Frequency Response
FM frequency deviation: 22.5 kHz

Figure 17. FM Input Level Sweep
Soft mute threshold Bits 68, $69=0$, Bit $70=1$; soft mute gain Bit $67=1$ gain FM IF amplifier Bit $89=1$, Bits $90,91=0$

Figure 18. Selectivity
Integrated bandfilter BW setting: 120 kHz desired signal level adjusted to $40 \mathrm{~dB} \mathrm{~S} / \mathrm{N}$ without undesired signal undesired signal level adjusted to 26 dB S/N

Figure 19. Test Circuit

Figure 20. Application Circuit

## Ordering Information

| Extended Type Number | Package | Remarks |
| :--- | :---: | :--- |
| U4255BM-MFN | SSO44 | Tube |
| U4255BM-MFNG3 | SSO44 | Taped and reeled |

## Package Information

## Atmel Headquarters

Corporate Headquarters 2325 Orchard Parkway San Jose, CA 95131
