

DP117-X/DP117-XR/ μ A117-X/ μ A117-XR Series Winchester Disk Read/Write Preamplifiers

General Description

The DP117-X/DP117-XR, μ A117-X/ μ A117-XR Series High Performance Read/Write Preamplifiers are intended for use in Winchester disk drives which employ center tapped ferrite or manganese-zinc read/write heads. The circuit can interface with up to eight read/write heads which makes it ideal for multi-platter disk drive designs. Designed to reside in the Head/Disk Assembly (HDA) of Winchester disk drives, the Read/Write Preamplifiers provide termination, gain, and output buffering for the disk heads as well as switched write current. Certain write fault conditions are detected and reported to protect recording integrity. The parts are available with internal damping resistor (DP117-R) and without internal damping resistor (DP117).

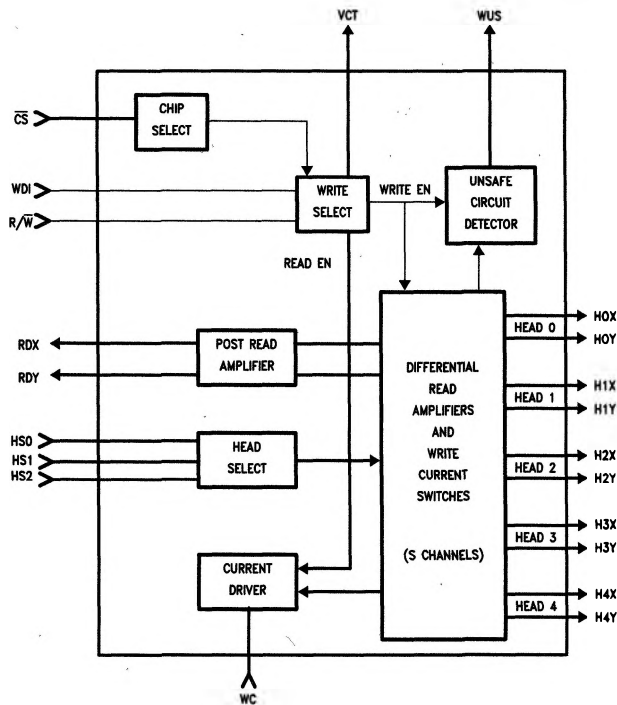

Features

- Wide bandwidth, high gain, low noise
- Up to eight read/write channels
- Internal write fault condition detection
- 5.0V and 12V power supply voltages
- Independent read and write data lines
- TTL control and data logic levels
- Externally programmable write current
- Available with internal damping resistor
- Compatible with SSI 117 family

Functional Description

In the Write mode, the DP117-X/DP117-XR, μ A117-X/ μ A117-XR Series accepts TTL compatible write data pulses on the WDI lead. On the falling edge of each write data pulse, a current transition is made in the selected head. Head selection is accomplished via TTL input signals: HS0, HS1, HS2 (see Table II). Internal circuitry senses the following conditions:

1. Absence of data transitions.
2. Open circuit head connection.
3. Absence of write current.
4. Short circuit head connection.
5. Idle or read mode.

Any or all of the above conditions would result in a high level on the write unsafe (WUS) output signal.

During read operations, the DP117-X amplifies the differential voltages appearing across the selected R/W head lead and applies the amplified signal differentially to data lines RDX and RDY.

Pin Descriptions

Lead	Name	Function
\overline{CS}	Chip Select	Chip Select High disables the read/write function of the device and forces idle mode. (TTL)
$\overline{R/W}$	Read/Write Select	A Logic High places the devices in read mode and a Logic Low forces write mode. Refer to Table I. (TTL)
H0X, Y through HSX, Y	Read/Write Head Connections	The DP117 has five pairs of read/write connections. The X and Y phases are made consistent with the read output, RDX and RDY, phases. (Differential)
RDX, Y	Read Data Outputs	The chip has one pair of read data outputs which is multiplexed to the appropriate head connections. (Differential)
HS0 through HS2	Head Select Inputs	The eight read/write heads are addressed with the head select inputs. Refer to Table II. (TTL)
WC	Write Current Input	This lead sets the current level for the write mode. An external resistor is connected from this lead to ground, and write current is determined by the value of this resistor divided into the write current constant K, which is typically 140V.
WDI	Write Data Input	The write data input toggles the write current between the X and Y selected head connections. Write current is switched on the negative edge of WDI. The initial direction for write current is the X side of the switch and is set upon entering read or idle mode. (TTL)
V_{DD2}	Resistor Center Tap	In some versions (determined by lead availability) of the DP117-X series, a resistor may be connected between RCT and V_{DD1} to reduce internal power dissipation. If this resistor is not used, RCT must be connected externally to V_{DD1} .
VCT	Center Tap Voltage	The center tap output provides bias voltage for the head inputs in read and write mode. It should be connected to the center tap of the read/write heads.
WUS	Write Unsafe	A high logic level at the write unsafe output indicates a fault condition during write. Write unsafe will also be high during read and idle mode. (Open collector)
