### Product Specification

### DESCRIPTION

The UC1842 family of control ICs provides in an 8-Pin mini-DIP the necessary features to implement off-line, fixed-frequency current-mode control schemes with a minimal external parts count. This technique results in improved line regulation, enhanced load response characteristics, and a simpler, easier to design control loop. Topological advantages include inherent pulse-by-pulse current limiting.

Protection circuitry includes built-in undervoltage lock-out and current limiting. Other features include fully-latched operation, a 1% trimmed bandgap reference, and start-up current less than 1mA.

These devices feature a totem-pole output designed to source and sink high peak current from a capacitive load, such as the gate of a power MOSFET. Consistent with N-channel power devices, the output is low in the OFF-state.

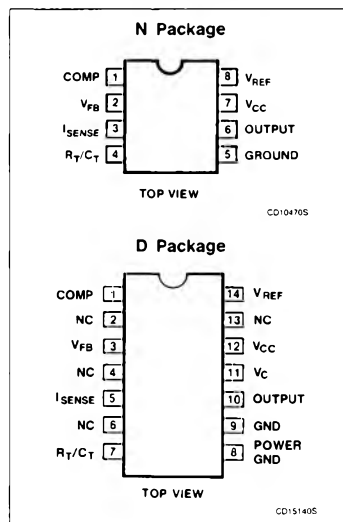

### FEATURES

- Low start-up current ( $\leq 1\text{mA}$ )
- Automatic feed-forward compensation
- Pulse-by-pulse current limiting
- Enhanced load response characteristics
- Undervoltage lock-out with hysteresis
- Double pulse suppression
- High current totem-pole output
- Internally-trimmed bandgap reference
- 400kHz operation, guaranteed min

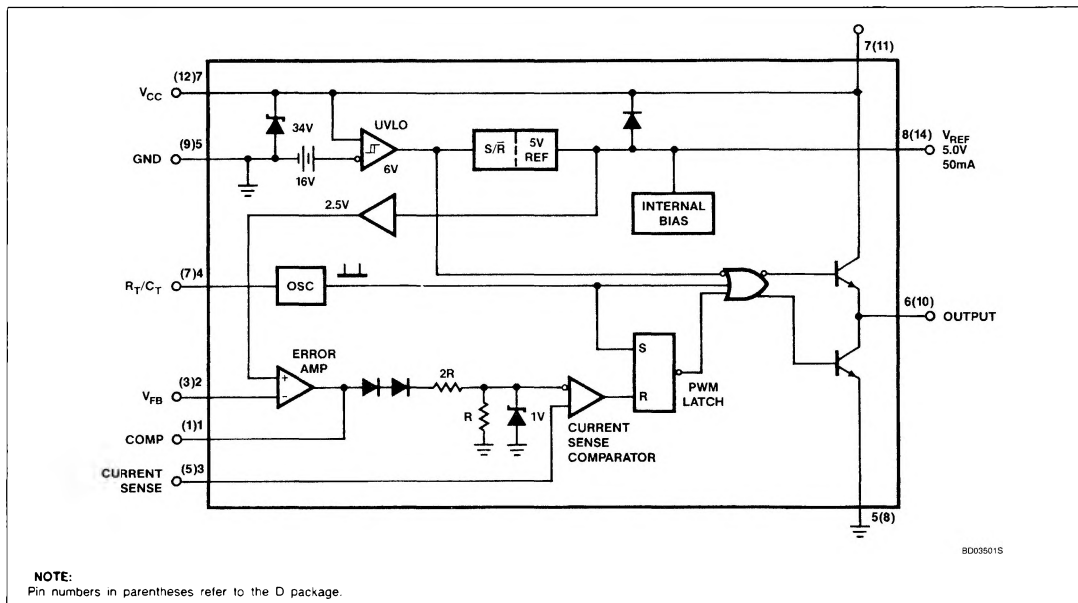

### APPLICATIONS

- Off-line switched mode power supplies
- DC-to-DC converters

UNDERVOLTAGE LOCKOUT

	UC1842
V <sub>ON</sub>	16V
V <sub>OFF</sub>	10V

LD06153S

NOTE:

During Undervoltage Lock-Out, the output driver is biased to a high impedance state. Pin 6 should be shunted to ground with a bleeder resistor to prevent activating the power switch with output leakage current.

ERROR AMP CONFIGURATION

LD06161S

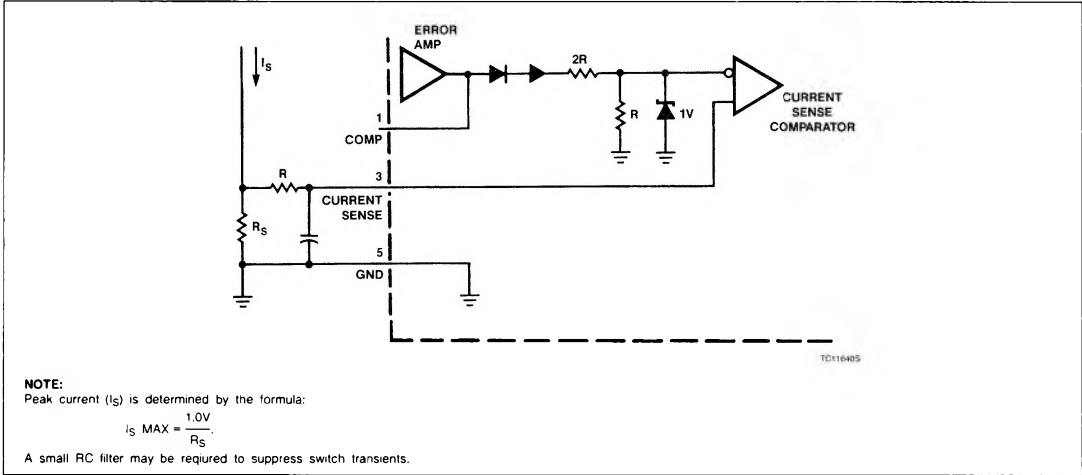

NOTE:

Error AMP can source or sink up to 0.5mA.

## SPECIFICATIONS

Input line voltage:	90V <sub>AC</sub> to 130V <sub>AC</sub>
Input frequency:	50 or 60Hz
Switching frequency:	40kHz ± 10%
Output power:	25W maximum
Output voltage:	5V ± 5%
Output current:	2 to 5A
Line regulation:	0.01%/V
Load regulation:	8%/A

Efficiency @ 25 W,

V <sub>IN</sub> = 90V <sub>AC</sub> :	70%
V <sub>IN</sub> = 130V <sub>AC</sub> :	65%

Output short-circuit current: 2.5A average

## NOTE:

This circuit uses a low-cost feedback scheme in which the DC voltage developed from the primary-side control winding is sensed by the UC1842 error amplifier. Load regulation is therefore dependent on the coupling between secondary and control windings, and on transformer leakage inductance. For applications requiring better load regulation, a UC1901 Isolated Feedback Generator can be used to directly sense the output voltage.
