

## MICROSTEP DRIVER FOR DRIVING CAMERA LENS

### DESCRIPTION

The  $\mu$ PD168110 is a monolithic 2-channel H bridge driver that consists of a CMOS controller and a MOS output stage. It can reduce the current consumption and the voltage loss at the output stage compared with a conventional driver using bipolar transistors, thanks to employment of a MOS process. This product employs a P-channel MOSFET on the high side of the output stage, eliminating a charge pump. As a result, the circuit current consumption can be substantially reduced during operation.

This product is ideal for driving the motor of a digital still camera as it can switch over between two-phase excitation driving and microstep driving, using a stepper motor.

### FEATURES

- Two H bridge circuits employing power MOSFET
- Current feedback 64-step microstep driving and two-phase excitation driving selectable
- Low on-resistance: 2  $\Omega$  MAX.
- 3 V power supply
  - Minimum operating power supply voltage  $V_{DD} = 2.7$  V
- Under voltage lockout circuit
  - Shuts down internal circuitry at  $V_{DD} = 1.7$  V TYP.
- 24-pin TSSOP

### ORDERING INFORMATION

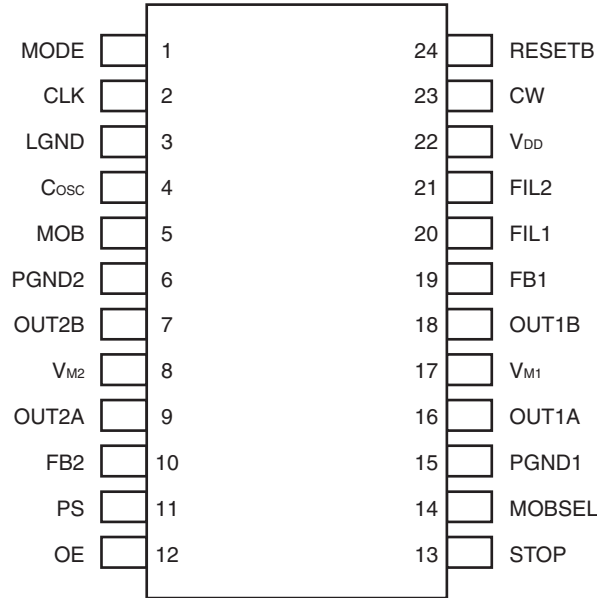

Part Number	Package
$\mu$ PD168110MA-6A5	24-pin plastic TSSOP (5.72 mm (225))

The information in this document is subject to change without notice. Before using this document, please confirm that this is the latest version.

Not all products and/or types are available in every country. Please check with an NEC Electronics sales representative for availability and additional information.

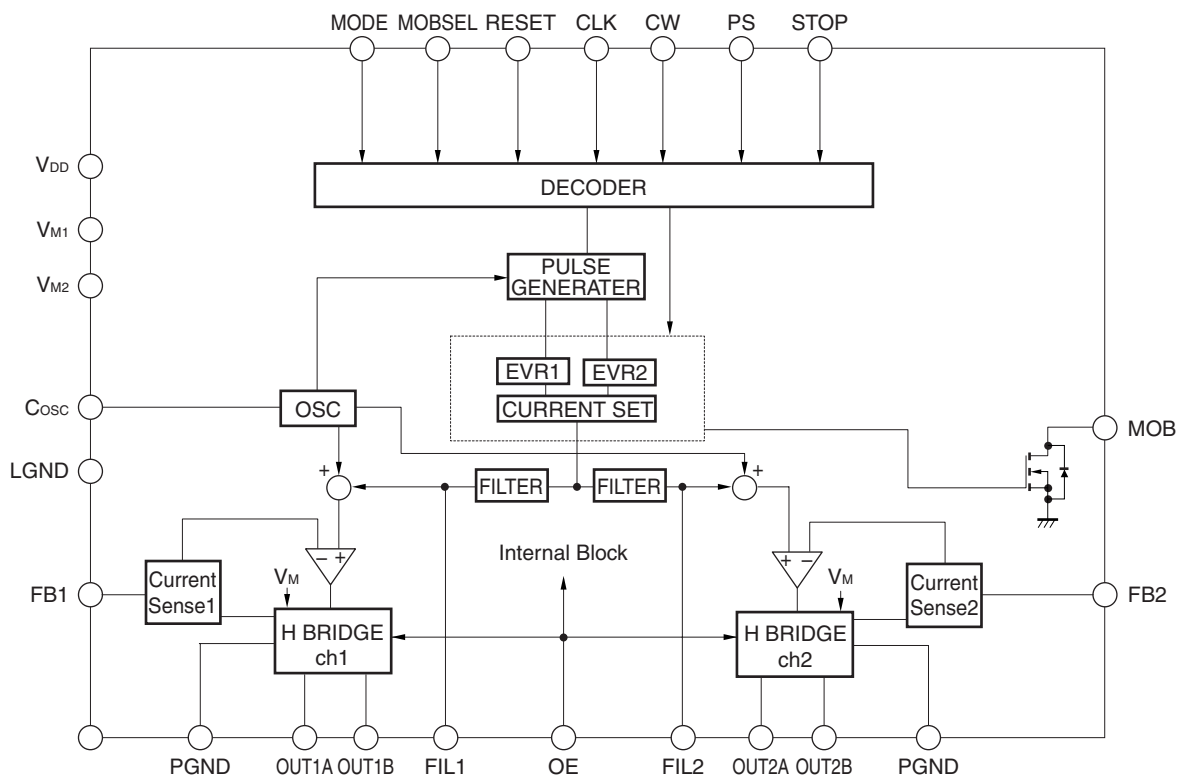

**PIN FUNCTIONS**

Package: 24-pin TSSOP

Pin No.	Pin Name	Pin Function
1	MODE	Microstep/2-phase excitation switch pin
2	CLK	Pulse input pin
3	LGND	Control block GND pin
4	Cosc	Pin connecting capacitor for output oscillator
5	MOB	Phase detection output pin
6	PGND2	Output block GND pin
7	OUT2B	Channel 2 output B
8	VM2	Motor power pin
9	OUT2A	Channel 2 output A
10	FB2	Channel 2 current detection resistor connecting pin
11	PS	Power save mode pin
12	OE	Output enable pin
13	STOP	Stop mode pin
14	MOBSEL	MOB output select pin
15	PGND1	Output block GND pin
16	OUT1A	Channel 1 output A
17	VM1	Motor power pin
18	OUT1B	Channel 1 output B
19	FB1	Channel 1 current detection resistor connecting pin
20	FIL1	Channel 1 filter capacitor connecting pin
21	FIL2	Channel 2 filter capacitor connecting pin
22	VDD	Control block power pin
23	CW	Revolution direction setting pin
24	RESETB	Reset input pin

**BLOCK DIAGRAM**

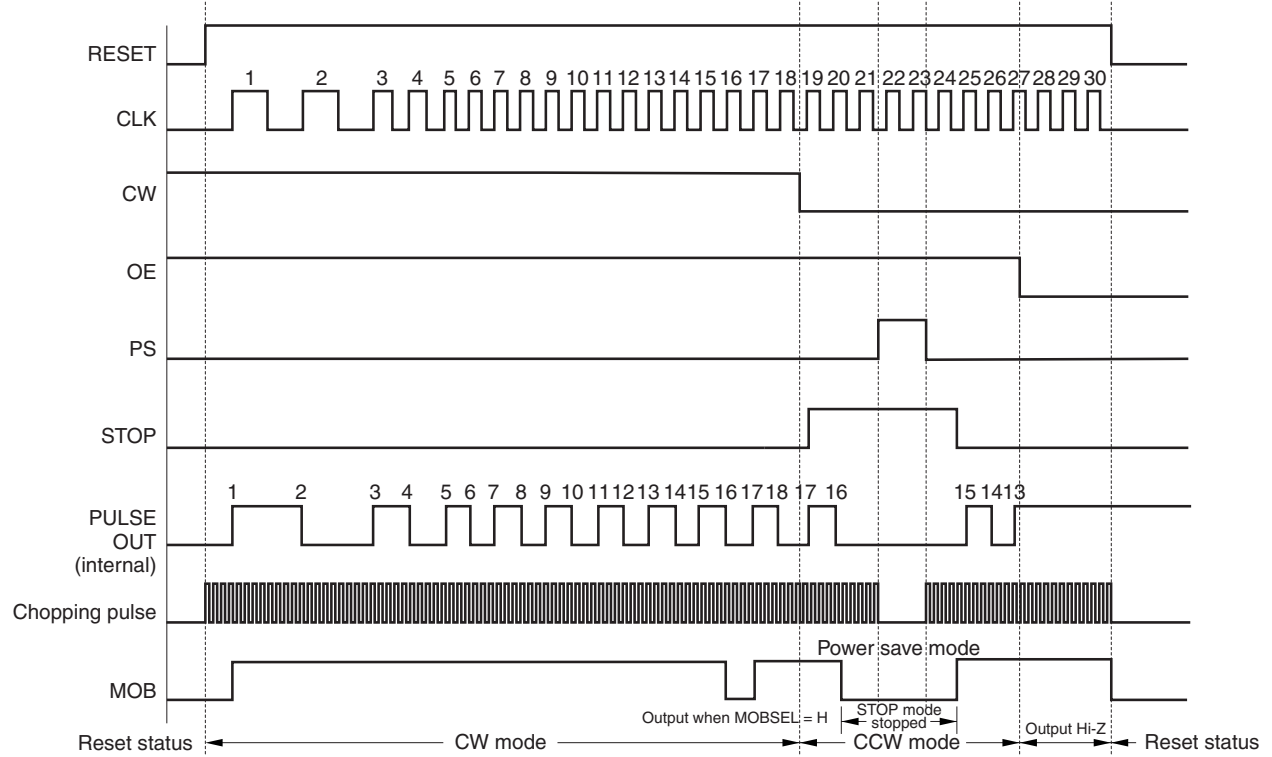

**Truth Table**

RESET	CLK	CW	OE	PS	STOP	MODE	MOBSSEL	Operation Mode
H		L	H	L	L	H	L	Microstep CW mode MOB: 1 pulse/cycle
H		H	H	L	L	H	L	Microstep CCW mode MOB: 1 pulse/cycle
H		L	H	L	L	H	H	Microstep CW mode MOB: 4 pulses/cycle
H		H	H	L	L	H	H	Microstep CCW mode MOB: 4 pulses/cycle
H		L	H	L	L	L	X	2-phase CW mode

θ16	90	–	100	–	–	0	3.8	100

The above values are ideal values and are not guaranteed values.

**FUNCTION DESCRIPTION**

**2-phase excitation driving mode**

By allowing a current of ±100% to flow into output ch1 and ch2 at the same time, a motor can be driven with the larger torque.

The two-phase excitation driving mode and microstep driving mode are switched by the MODE pin. In the two-phase excitation driving mode, the chopping pulse circuit does not operate.

**Microstep driving of stepper motor**

To position a stepper motor with high accuracy, the μPD168110 has a function to hold constant the current flowing through the H bridge by a vector value and to stop one cycle in 64 steps. To realize the microstep driving mode, the driver internally realizes the following functions.

- Detecting the current flowing into each channel as a voltage value by a sense resistor
- Synthesizing the dummy sine wave of the half-wave generated by the internal D/A and PWM oscillation wave for chopping operation
- The driver stage performs PWM driving based on the result of comparing the detected voltage value and synthesized waves.

The internal dummy sine wave is of 64 steps per cycle, so that the stepper motor can be driven in 64 steps. The microstep driving mode and two-phase excitation driving mode are switched by an external pin.

Concept of microstep driving operation

**MOB output**

The MOB output pin outputs “L” if the current of ch1 or ch2 reaches ±100% in the microstep output mode, or if the current of ch 1 reaches +100%. In the two-phase excitation output mode, the MOB pin outputs “L” when the current of ch1 and ch2 reaches +100%. The excitation position of the stepper motor can be checked by monitoring the MOB output. The MOB output also indicates the stop position information in the stop mode to be explained below.

The MOB output goes into a Hi-Z state (output H level if pulled up) when OE = “L”.

**Stop mode**

If the stop mode is set by the STOP pin, the pulse is automatically output until MOB = “L” when CLK is input. If MOB = “L” in the stop mode, the pulse is not output even when CLK is input, and the output holds the excitation status.

To advance the pulse, release the stop mode and restore the normal mode.

**Reset function**

When RESET = "L", initialization is executed and the output goes into a Hi-Z state. When RESET = "H", excitation is started with the current of ch1 at +100% and the current of ch2 at 0% (one-phase excitation position). To perform two-phase excitation driving, excitation is started with the currents of ch1 and ch2 at +100% after the mode has been set. Be sure to execute a reset operation after power application. MOB outputs "L" until the pulse is output when RESET goes "L".

**Output enable (OE) pin**

The pulse output can be forcibly stopped from an external source by using the OE pin. When OE = "L", the output is forcibly made to go into a Hi-Z state.

**Standby function**

The  $\mu$ PD168110 can enter the standby mode when the pulse is not output and when PS = "H" and STOP = "H". In the standby mode, as many internal circuits as possible are stopped so that the self current consumption can be reduced. In the standby mode, the current consumption is 1  $\mu$ A MAX. when external CLK input is stopped. While CLK is being input, the current consumption is reduced to 300  $\mu$ A MAX. by the current flowing into the input buffer. The standby mode is released when PS = "L" and STOP = "L".

**Under voltage lockout circuit (UVLO)**

This function is used to forcibly stop the operation of the IC to prevent malfunction of the circuits if  $V_{DD}$  of the IC drops during operation. Note that if the  $V_{DD}$  voltage abruptly drops in the order of  $\mu$ s, this function may not operate.

 **$V_M$  pin current shutdown circuit**

A circuit that prevents a current from flowing into the  $V_M$  pin when  $V_{DD} = 0$  V is provided. Therefore, the current flowing into the  $V_M$  pin is cut off when  $V_{DD} = 0$  V.

A current of up to 3  $\mu$ A flows into the  $V_M$  pin when  $V_{DD}$  is applied so that the voltages on the  $V_{DD}$  and  $V_M$  pins can be monitored.

**OPERATION DESCRIPTION**

- Setting output current

The peak value of the output current (when current of ch 1 or ch 2 is 100%) is determined by the resistor R<sub>FB</sub> that is connected to FB1 and FB2. This IC has an internal reference power supply V<sub>REF</sub> (500 mV TYP.) for comparing current, and drives the stepper motor with the current value calculated by R<sub>FB</sub> and V<sub>REF</sub> as the peak output current value.

Peak output current value I<sub>MAX</sub> (A) ≡ V<sub>REF</sub> (V) ÷ R<sub>FB</sub> (Ω) × 1000

- Pulse output

The motor is driven by inputting a pulse to the CLK pin. The motor advances by one pulse at the rising edge of the CLK signal. When MODE = “H”, the motor is driven in the 64-microstep driving mode, and the driving current of each step is determined based on the internal motor excitation position information and revolution direction. When MODE = “L”, the two-phase excitation mode is selected, and the current direction (100% drive) of ch 1 and ch 2 are switched each time a pulse has been input.

- Setting motor revolution direction

The revolution direction of the motor is set by CW. In the CW mode (CW = “L”), the current of ch2 is output, 90° degrees in phase behind the current of ch1. In the CCW mode (CW = “H”), the current of ch2 is output, 90° degrees in phase ahead of the current of ch1.

CW Pin	Operation Mode
L	CW mode (forward revolution)
H	CCW mode (reverse revolution)

- Setting stop mode (valid only in microstep driving mode)

When STOP = “H”, the motor advances to the position of MOB output = “L”, and the output status is held.

The excitation status is not changed even when a pulse is input to CLK while MOB = “L” when STOP = “H”. The pulse can be advanced when STOP = “L”.

STOP	Operation Mode
L	Normal mode
H	Stop mode

**Caution** If STOP = “L” before the stop mode is set (until MOB = “L”), the operation is performed in the same manner as in the normal mode.

• **Power save mode (valid only in microstep driving mode)**

When PS = “H” and STOP = “H”, the motor advances to the position of MOB output = “L” and then the output goes to a Hi-Z state.

The internal circuitry is stopped as much as possible and the standby mode is set. The power save mode is released when PS = “L” and STOP = “L”.

STOP	Operation Mode
L	Normal mode
H	Power save mode (only when STOP = “H”)

**Caution** Inputting PS = “H” and STOP = “L” is prohibited.

• **Setting output enable**

When OE = “H”, the motor is driven (output excitation status). Be sure to set OE to “H” to drive the motor.

STOP	Operation Mode
L	Output Hi-Z
H	Enable mode

• **Selecting two-phase excitation/microstep driving mode**

The MODE pin can be used to select the two-phase excitation or microstep driving mode. When MODE = “H”, the microstep driving mode is selected. When MODE = “L”, the two-phase excitation mode (both ch 1 and ch 2 are driven at +100% or -100%) is selected. The μPD168110 is initialized immediately after a RESET operation, so excitation is started from the position at which the output current of ch 1 is 100% and the output current of ch 2 is 0% in the microstep driving mode, and from the position at which the output currents of both ch 1 and ch 2 are +100% in the two-phase excitation driving mode.

If the mode is changed from the microstep to the two-phase, the position of the microstep mode is retained until CLK is input. When the first CLK is input, pulse output is started, the operation skips to the two-phase position of the next quadrant, and driving is started.

MODE	Operation Mode
L	2-phase excitation
H	Microstep driving

Concept of switching operation mode from microstep to 2-phase excitation

- Selecting MOB output (in microstep driving mode only)

The output function of MOB can be selected by MOBSEL. When MOBSEL = "L", MOB is output at the position where the current of ch1 is +100% and the current of ch2 is 0%. When MOBSEL = "H", MOB is output at the position where the current of ch1 or ch2 is ±100%.

MOBSEL	MOB Output
L	Current of ch1 is +100% and current of ch2 is 0% (1 pulse/cycle).
H	Current of ch1 or ch2 is ±100% (4 pulses/cycle).

**ABSOLUTE MAXIMUM RATINGS**

(T<sub>A</sub> = 25°C: GLASS EPOXY BOARD OF 100 mm × 100 mm × 1 mm WITH COPPER FOIL OF 15%)

**ELECTRICAL CHARACTERISTICS (UNLESS OTHERWISE SPECIFIED,  $V_{DD} = V_M = 3\text{ V}$ ,  $T_A = 25^\circ\text{C}$ )**

Parameter	Symbol	Conditions	MIN.	TYP.	MAX.	Unit
$V_{DD}$ pin current after reset	$I_{DD(STB)}$	External CLK stopped			1.0	$\mu\text{A}$
$V_{DD}$ pin current in standby mode	$I_{DD(STB2)}$	External CLK stopped			30	$\mu\text{A}$
	$I_{DD(STB3)}$	External CLK is input			300	$\mu\text{A}$
$V_{DD}$ pin current during operation	$I_{DD(ACT)}$				3.0	$\text{mA}$
$V_M$ pin current	$I_{M(OFF)}$	$V_M = 5.5\text{ V}$ per $V_M$ pin, after reset and in standby mode			3.0	$\mu\text{A}$
High-level input current	$I_{IH}$	$V_{IN} = V_{DD}$			1.0	$\mu\text{A}$
Low-level input current	$I_{IL}$	$V_{IN} = 0\text{ V}$	-1.0			$\mu\text{A}$
High-level input voltage	$V_{IH}$	$2.7\text{ V} \leq V_{DD} \leq 3.6\text{ V}$	$0.7 \times V_{DD}$			$\text{V}$
Low-level input voltage	$V_{IL}$	$2.7\text{ V} \leq V_{DD} \leq 3.6\text{ V}$			$0.3 \times V_{DD}$	$\text{V}$
Input hysteresis voltage	$V_{hys}$			0.3		$\text{V}$
H bridge on-resistance	$R_{ON}$	$I_M = 0.35\text{ A}$ , sum of upper and lower stages, $FB1 = FB2 = 0\text{ V}$			2.0	$\Omega$
Output turn-on time	$t_{ON}$	$R_M = 20\ \Omega$ OE pin $\uparrow \rightarrow$ output SW time	0.02		0.5	$\mu\text{s}$
Output turn-off time	$t_{OFF}$		0.02		0.5	$\mu\text{s}$
Internal reference voltage	$V_{REF}$		450	500	550	$\text{mV}$
Output detection ratio		$I_M = 0.1\text{ A}$ , with $2.5\text{ k}\Omega$ sense resistor connected	950	1050	1150	

- Cautions 1.** The undervoltage lockout detection circuit (UVLO) operates at 1.7 V TYP. whereupon the output goes into a Hi-Z state. Internal data such as the excitation position information is reset. The UVLO circuit does not operate after reset.
- 2.** A shutdown circuit that prevents a current from flowing into the  $V_M$  pin when  $V_{DD} = 0\text{ V}$  is provided.

Soldering Method	Soldering Conditions	Recommended Condition Symbol
Infrared reflow	Package peak temperature: 260°C, Time: 60 seconds max. (at 220°C or higher), Count: Three times or less, Exposure limit: None, Flux: Rosin flux with low chlorine (0.2 Wt% or below) recommended	IR60-00-3

**Caution Do not use different soldering methods together (except for partial heating).**

[MEMO]

## NOTES FOR CMOS DEVICES

**① PRECAUTION AGAINST ESD FOR SEMICONDUCTORS**

Note:

Strong electric field, when exposed to a MOS device, can cause destruction of the gate oxide and ultimately degrade the device operation. Steps must be taken to stop generation of static electricity as much as possible, and quickly dissipate it once, when it has occurred. Environmental control must be adequate. When it is dry, humidifier should be used. It is recommended to avoid using insulators that easily build static electricity. Semiconductor devices must be stored and transported in an anti-static container, static shielding bag or conductive material. All test and measurement tools including work bench and floor should be grounded. The operator should be grounded using wrist strap. Semiconductor devices must not be touched with bare hands. Similar precautions need to be taken for PW boards with semiconductor devices on it.

**② HANDLING OF UNUSED INPUT PINS FOR CMOS**

Note:

No connection for CMOS device inputs can be cause of malfunction. If no connection is provided to the input pins, it is possible that an internal input level may be generated due to noise, etc., hence causing malfunction. CMOS devices behave differently than Bipolar or NMOS devices. Input levels of CMOS devices must be fixed high or low by using a pull-up or pull-down circuitry. Each unused pin should be connected to  $V_{DD}$  or GND with a resistor, if it is considered to have a possibility of being an output pin. All handling related to the unused pins must be judged device by device and related specifications governing the devices.

**③ STATUS BEFORE INITIALIZATION OF MOS DEVICES**

Note:

Power-on does not necessarily define initial status of MOS device. Production process of MOS does not define the initial operation status of the device. Immediately after the power source is turned ON, the devices with reset function have not yet been initialized. Hence, power-on does not guarantee out-pin levels, I/O settings or contents of registers. Device is not initialized until the reset signal is received. Reset operation must be executed immediately after power-on for devices having reset function.

- **The information in this document is current as of February, 2003. The information is subject to change without notice. For actual design-in, refer to the latest publications of NEC Electronics data sheets or data books, etc., for the most up-to-date specifications of NEC Electronics products. Not all products and/or types are available in every country. Please check with an NEC Electronics sales representative for availability and additional information.**
- No part of this document may be copied or reproduced in any form or by any means without the prior written consent of NEC Electronics. NEC Electronics assumes no responsibility for any errors that may appear in this document.
- NEC Electronics does not assume any liability for infringement of patents, copyrights or other intellectual property rights of third parties by or arising from the use of NEC Electronics products listed in this document or any other liability arising from the use of such products. No license, express, implied or otherwise, is granted under any patents, copyrights or other intellectual property rights of NEC Electronics or others.
- Descriptions of circuits, software and other related information in this document are provided for illustrative purposes in semiconductor product operation and application examples. The incorporation of these circuits, software and information in the design of a customer's equipment shall be done under the full responsibility of the customer. NEC Electronics assumes no responsibility for any losses incurred by customers or third parties arising from the use of these circuits, software and information.
- While NEC Electronics endeavors to enhance the quality, reliability and safety of NEC Electronics products, customers agree and acknowledge that the possibility of defects thereof cannot be eliminated entirely. To minimize risks of damage to property or injury (including death) to persons arising from defects in NEC Electronics products, customers must incorporate sufficient safety measures in their design, such as redundancy, fire-containment and anti-failure features.
- NEC Electronics products are classified into the following three quality grades: "Standard", "Special" and "Specific".

The "Specific" quality grade applies only to NEC Electronics products developed based on a customer-designated "quality assurance program" for a specific application. The recommended applications of an NEC Electronics product depend on its quality grade, as indicated below. Customers must check the quality grade of each NEC Electronics product before using it in a particular application.

"Standard": Computers, office equipment, communications equipment, test and measurement equipment, audio and visual equipment, home electronic appliances, machine tools, personal electronic equipment and industrial robots.

"Special": Transportation equipment (automobiles, trains, ships, etc.), traffic control systems, anti-disaster systems, anti-crime systems, safety equipment and medical equipment (not specifically designed for life support).

"Specific": Aircraft, aerospace equipment, submersible repeaters, nuclear reactor control systems, life support systems and medical equipment for life support, etc.

The quality grade of NEC Electronics products is "Standard" unless otherwise expressly specified in NEC Electronics data sheets or data books, etc. If customers wish to use NEC Electronics products in applications not intended by NEC Electronics, they must contact an NEC Electronics sales representative in advance to determine NEC Electronics' willingness to support a given application.

(Note)

- (1) "NEC Electronics" as used in this statement means NEC Electronics Corporation and also includes its majority-owned subsidiaries.
- (2) "NEC Electronics products" means any product developed or manufactured by or for NEC Electronics (as defined above).
