

MOS INTEGRATED CIRCUIT

μ PD703000, 703001

V851™

32-/16-BIT SINGLE-CHIP MICROCONTROLLER

DESCRIPTION

The μ PD703000 is a product in the V850 family™ of 32-bit single-chip microcontrollers for real-time control applications. It integrates a 32-bit CPU, ROM, RAM, interrupt controller, real-time pulse unit, and serial interface on a single chip.

The μ PD703001 is a ROM-less model of the μ PD703000.

The functions are described in detail in the following manuals. Be sure to read these manuals when designing your system.

V851 User's Manual - Hardware : U10935E

V850 Family User's Manual - Architecture : U10243E

FEATURES

- Number of instructions: 74
- Minimum instruction execution time: 30 ns (at 33 MHz)
- General-purpose register: 32 bits x 32
- Instruction set ideal for control application
- Internal memory ROM : 32K bytes (μ PD703000)
 RAM : 1K bytes (μ PD703000, 703001)
- High-performance interrupt controller
- Real-time pulse unit ideal for control
- Powerful serial interface (dedicated baud rate generator)
- Clock generator
- Power save function

APPLICATION FIELD

- System control fields using servo motor (PPCs, printers, and NC machine tools)
- Other control fields requiring high response speed (engine control, etc.)

The μ PD703000 is treated as the representative model in this document.

The information in this document is subject to change without notice.

2. FUNCTION BLOCKS

2.1 Internal Units

2.1.1 CPU

Most instructions, such as address calculation, arithmetic and logic operation, and data transfer, are executed in one clock cycle under control of 5-stage pipeline.

The CPU also includes dedicated hardware such as a multiplier (16 by 16) and a 32-bit barrel shifter, aiming at processing complex instructions at high speeds.

In addition, the CPU can access internal ROM (32 KB) and RAM (1 KB) in one clock cycle.

2.1.2 Bus control unit (BCU)

★ The BCU initiates necessary external bus cycles based on the physical address given by the CPU. When an instruction fetch is executed from external memory area, if no bus cycle initiation is requested by the CPU, the BCU creates a prefetch address to prefetch an instruction code. The prefetched instruction code is taken into the internal instruction queue.

2.1.3 ROM

The ROM has a capacity of 32 KB and is mapped from the address 00000000H. Access to the ROM is enabled/disabled by setting the MODE0 and MODE1 pins.

The CPU can access any address of the ROM in one clock cycle (to fetch an instruction).

2.1.4 RAM

This RAM has a capacity of 1 KB and is mapped from address FFFFE000H. The CPU can access any address of the RAM in one clock cycle (to access data).

2.1.5 Port

The μPD703000 is provided with a total of 68 input/output port pins (of which one is an input port pin), or ports 0 through 10. These port pins can be used as the control pins.

2.1.6 Interrupt controller

The interrupt controller controls various interrupt requests (NMI, INTP00-INTP03, and INTP10-INTP13) issued by peripheral hardware or external devices. Up to eight levels of interrupt priority can be individually specified for each interrupt request. In addition, multiplexed processing control can be performed.

2.1.7 Clock generator

The clock generator generates a CPU operating clock whose frequency is 5 times as high as (with the internal PLL) or half (without the internal PLL) the frequency of the resonator connected across the X1 and X2 pins. Instead of connecting a resonator, a clock signal can be input from off-chip.

2.1.8 Realtime pulse unit (RPU)

The RPU which includes a 16-bit timer/event counter and a 16-bit interval timer, measures pulse intervals and pulse frequency, and outputs programmable pulses.

2.1.9 Serial interface

The serial interface includes one channel of UART (asynchronous serial interface) and one channel of CSI (clocked serial interface).

The UART transfers data with the TXD and RXD pins. The baud rate is generated by an on-chip dedicated baud rate generator. The CSI transfers data with the SO, SI, and $\overline{\text{SCK}}$ pins. The baud rate can be generated from an on-chip dedicated baud rate generator, or supplied from off-chip.

3. CPU FUNCTION

The CPU of the μ PD703000 is based on the RISC architecture and executes almost all the instructions in one clock cycle, using a 5-stage pipeline.

3.1 Features

- Minimum instruction execution time: 30 ns (internal 33 MHz)
- Address space: 16-MB linear
- General registers: 32 bits x 32
- Internal 32-bit architecture
- Five-stage pipeline control
- Multiplication/division instruction
- Saturated operation instruction
- 32-bit shift instruction: 1 clock
- Long/short format
- Internal memory
 - ROM: 32K bytes
 - RAM: 1K bytes
- Bit manipulation instructions: 4 types
 - Set
 - Clear
 - Not
 - Test

4. BUS CONTROL FUNCTION

4.1 Features

- External device connectable with port pins
- Wait function
 - Programmable wait function inserting up to 3 states per 2 blocks
 - External wait function effected by $\overline{\text{WAIT}}$ pin
- Idle state inserting function
- Bus arbitration function
- Bus hold function

5. INTERRUPT/EXCEPTION HANDLING

5.1 Features

- Interrupt
 - Non-maskable : 1 source
 - Maskable : 14 sources
 - 8-level programmable priority control
 - Multiplexed processing control according to priority
 - Masking each maskable interrupt request
 - Valid edge specification for external interrupt request
- Exception
 - Software exception : 32 sources
 - Exception trap : 1 source (illegal instruction code exception)

5.2 Configuration

	Interrupt	INTP03	P0IC3	INTP03 pin	Pin	13	0150H	00000150H	next PC

Note The "n" in the "Software exception " rows is a value from 0 to FH.

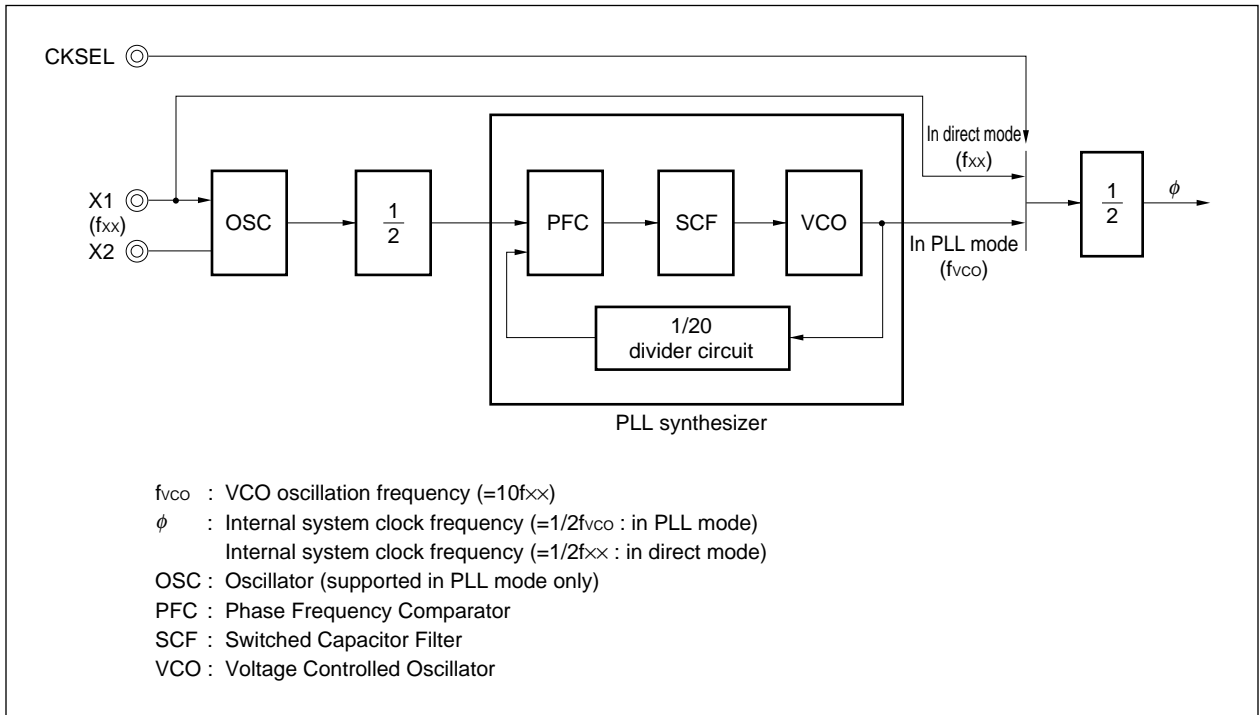

- Remarks**
1. Default priority: Priority used when two or maskable interrupt requests are simultaneously generated. 0 indicates the highest priority.
Restore PC: PC value saved to EIPC or FEPC when interrupt/exception processing is started. However, the restore PC value saved if an interrupt is accepted while the DIVH (division) instruction is being executed is the PC value of the current instruction (DIVH).
 2. The execution address of an illegal instruction when an illegal instruction code exception occurs can be calculated as (restore PC – 4).

6. CLOCK GENERATOR

6.1 Features

- Multiply function by PLL clock synthesizer ($f_{xx} = \frac{1}{5} \times \phi$)
- Direct mode directly to input external clock
- Power save mode
 - HALT mode
 - IDLE mode
 - Software STOP mode
- Clock output inhibit function

6.2 Configuration

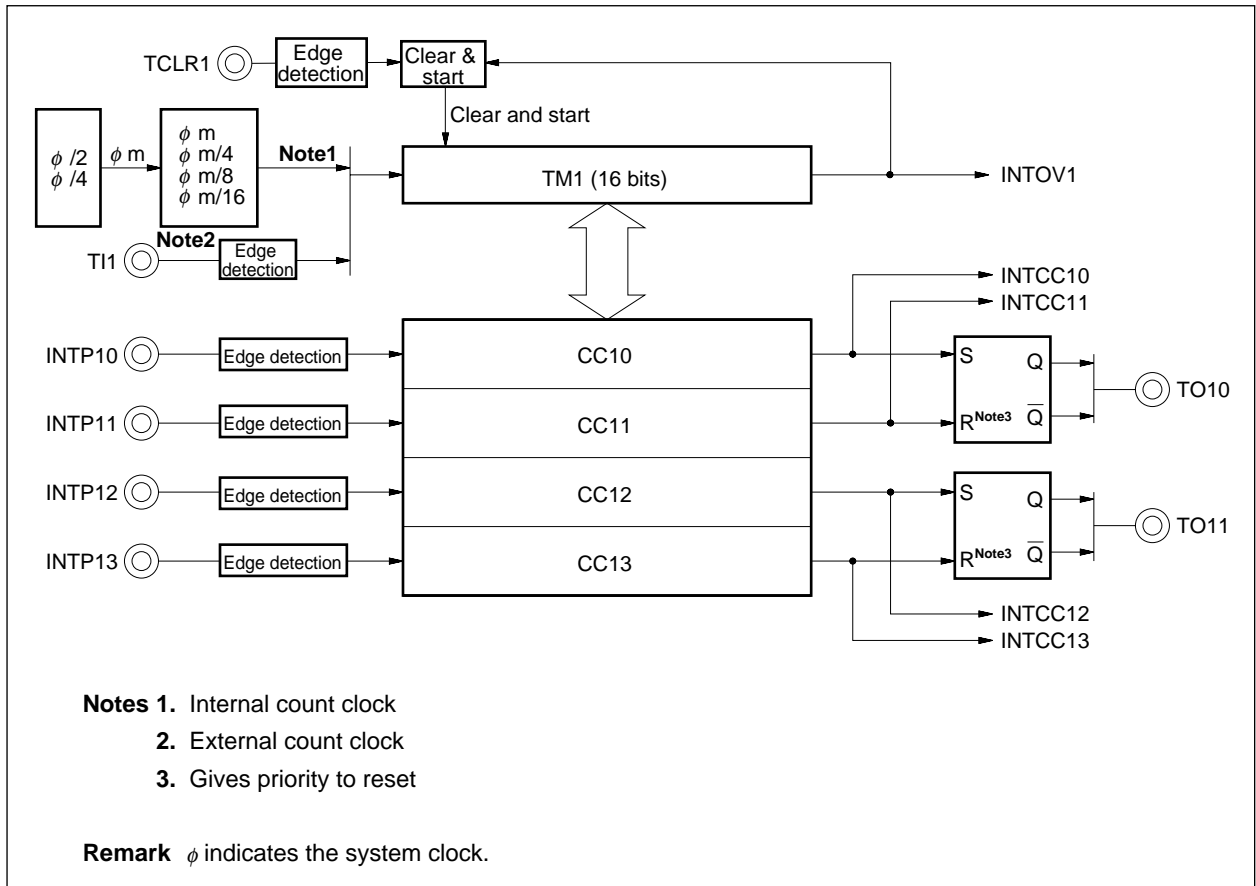

7. TIMER/COUNTER FUNCTION (Real Time Pulse Unit)

7.1 Features

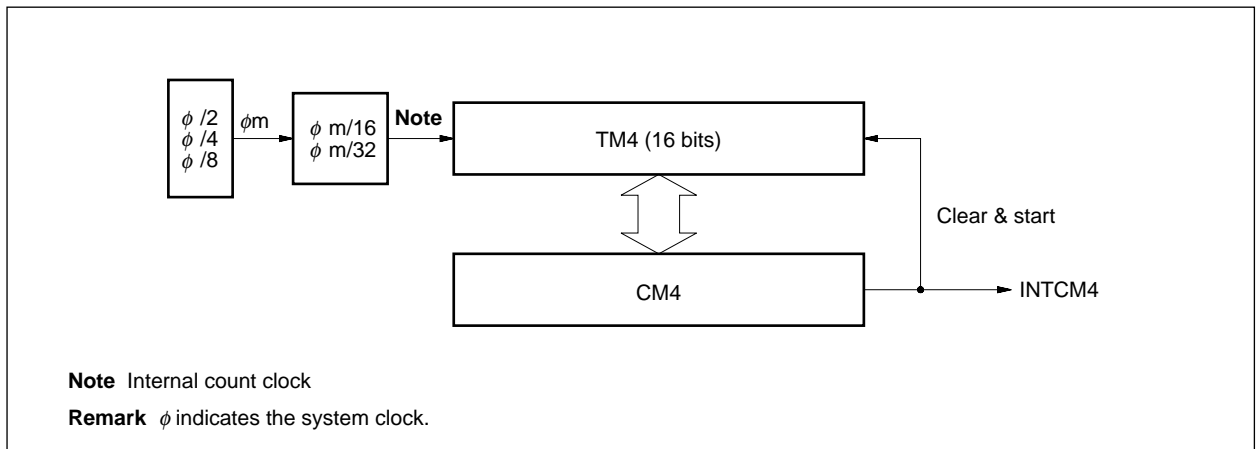

- Pulse interval and frequency measurement and output of programmable pulse
 - 16-bit measurement possible
 - Pulse can be generated in various shapes (interval pulse, one-shot pulse)
- Timer 1
 - 16-bit timer/event counter
 - Sources of count clock: 2 types (divided system clock or external pulse input)
 - Capture/compare registers: 4
 - Count clear pin: TCLR1
 - Interrupt sources: 5
 - External pulse output: 2
- Timer 4
 - 16-bit interval timer
 - Count clock selected from divided system clock
 - Compare register: 1
 - Interrupt source: 1

7.2 Configuration

(1) Timer 1 (16-bit timer/event counter)

(2) Timer 4 (16-bit interval timer)

8. SERIAL INTERFACE FUNCTION (SIO)

8.1 Features

The μ PD703000 is provided with the following two types of interface methods as serial interface functions, each of which has one channel:

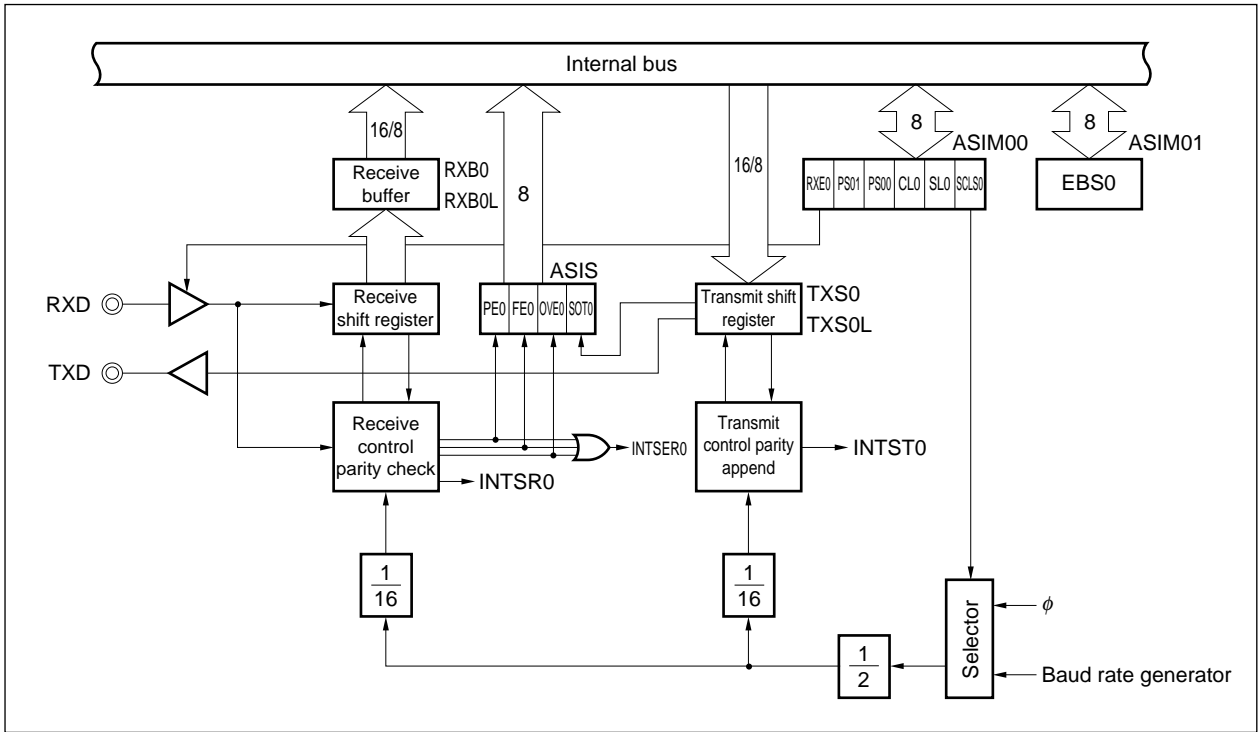

- (1) Asynchronous serial interface (UART)
- (2) Clocked serial interface (CSI)

8.2 Asynchronous Serial Interface (UART)

8.2.1 Features

- Transfer rate: 150 bps to 76800 bps (system clock: 33 MHz)
- Full-duplex communication
- 2-pin configuration
 - TXD: Transmit data output pin
 - RXD: Receive data input pin
- Receive error detection function
 - Parity error
 - Framing error
 - Overrun error
- Three interrupt sources
 - Receive error interrupt (INTSER0)
 - Reception completion interrupt (INTSR0)
 - Transmission interrupt (INTST0)
- Character length of transmission/reception data is specified by ASIM0 and ASIM1 registers.
- Character length : 7, 8 bits
 - 9 bits (with extended bit appended)
- Parity function : odd, even, 0, none
- Transmission stop bit: 1, 2 bits
- Baud rate generator

8.2.2 Configuration

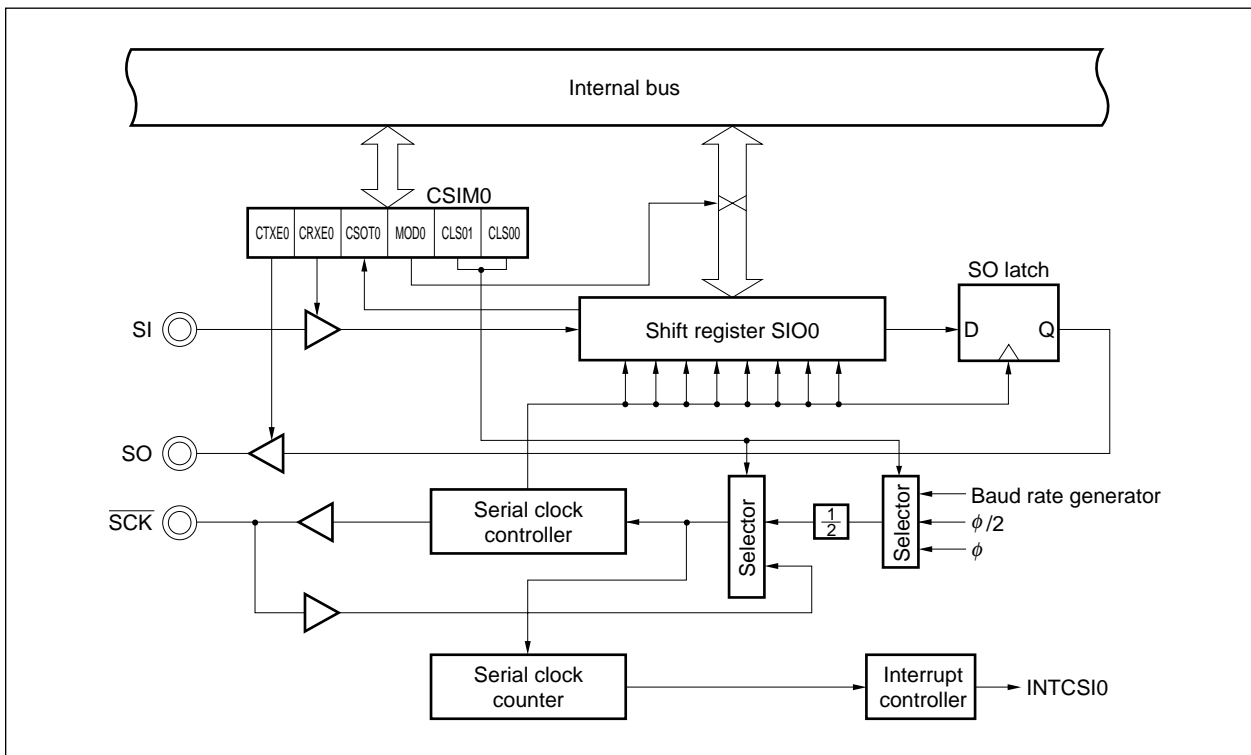

8.3 Clocked Serial Interface (CSI)

8.3.1 Features

- High-speed transfer rate
8.25 Mbps MAX. (system clock: 33 MHz)
- Half-duplex communication
- Data length of 8 bits
- Selection of external or internal clock
- Three pins used
SO : Serial data output pin
SI : Serial data input pin
 \overline{SCK} : Serial clock I/O pin
- One interrupt source
 - Interrupt request signal (INTCSI0)

8.3.2 Configuration

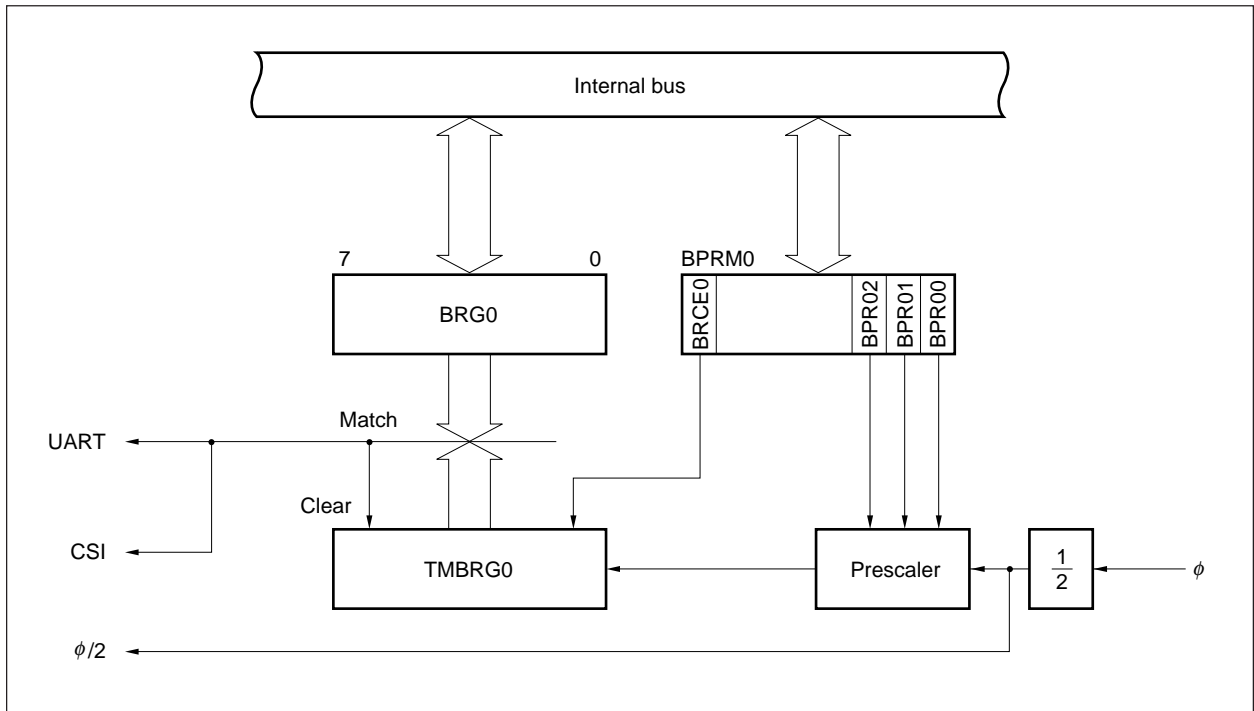

8.4 Baud Rate Generator (BRG)

8.4.1 Features

- Serial clock selectable from baud rate generator output and ϕ (system clock)
- Same baud rate for transmission/reception

8.4.2 Configuration

9. PORT FUNCTION

9.1 Features

The ports of the μPD703000 have the following features:

- Number of port pins
 Input port : 1
 I/O port : 67
- Shared with I/O pins of other peripheral functions
- Input/output specifiable bitwise
- Noise elimination
- Edge detection

10. RESET FUNCTION

When the $\overline{\text{RESET}}$ signal is made low, the system is reset, and the on-chip hardware units are initialized.

The reset status is cleared when the $\overline{\text{RESET}}$ signal is made high, and the CPU starts executing the program. Initialize the contents of each register in the program as necessary.

10.1 Features

- Noise elimination circuit of analog delay (\approx 60 ns) provided to reset pin

Clock input voltage	V _X	X1 pin, V _{DD} = 5.0±10%	-0.5 to V _{DD} +1.0	V
Output current, low	I _{OL}	1 pin	4.0	mA
		Total of all pins	100	mA
Output current, high	I _{OH}	1 pin	-4.0	mA
		Total of all pins	-100	mA
Output voltage	V _O	V _{DD} = 5.0 V±10%	-0.5 to V _{DD} +0.3	V
Operating temperature	T _A	Operating at 25 MHz	-40 to +85	°C
		Operating at 33 MHz	-20 to +70	°C
Storage temperature	T _{stg}		-65 to +150	°C

Cautions 1. Do not directly connect to the output (or I/O) pins of an IC product, or to the V_{DD}, V_{CC}, or GND.

Open-drain pins and open-collector pins may be connected each other however. Moreover, an external circuit that is designed so as to avoid output contention can be directly connected to a pin that goes into a high-impedance state.

2. If even one of the parameters exceeds the absolute maximum ratings even momentarily, the quality of the product may be impaired. The absolute maximum ratings specify the values exceeding which the product may be physically damaged. Never exceed these ratings when using the products.

The specifications and conditions shown in DC and AC Characteristics below specify the range in which the product operates normally and the product quality is guaranteed.

- Cautions**
1. Connect the oscillation circuit as closely to the X1 and X2 pins as possible.
 2. Do not wire any other signal lines in the area indicated by the dotted line in the above figure.
 3. Thoroughly evaluate the matching between the μPD703000 and oscillator.

(b) External clock input

Caution Input the voltage at the CMOS level to the X1 pin.

Clock input voltage	V _X	X1 pin, V _{DD} = 3.0 to 3.6 V	-0.5 to V _{DD} +1.0	V
Output current, low	I _{OL}	1 pin	4.0	mA
		Total of all pins	100	mA
Output current, high	I _{OH}	1 pin	-4.0	mA
		Total of all pins	-100	mA
Output voltage	V _O	V _{DD} = 3.0 to 3.6 V	-0.5 to V _{DD} +0.3	V
Operating temperature	T _A		-20 to +70	°C
Storage temperature	T _{stg}		-65 to +150	°C

Cautions 1. Do not directly connect to the output (or I/O) pins of an IC product, or to the V_{DD}, V_{CC}, or GND.

Open-drain pins and open-collector pins may be connected each other however. Moreover, an external circuit that is designed so as to avoid output contention can be directly connected to a pin that goes into a high-impedance state.

2. If even one of the parameters exceeds the absolute maximum rating even momentarily, the quality of the product may be affected. The absolute maximum ratings specify the values exceeding which the product may be physically damaged. Never exceed these ratings when using the product.

The specifications and conditions shown in DC and AC Characteristics below specify the range in which the product operates normally and the product quality is guaranteed.

- Cautions**
1. Connect the oscillation circuit as closely to the X1 and X2 pins as possible.
 2. Do not wire any other signal lines in the area indicated by the dotted line in the above figure.
 3. Thoroughly evaluate the matching between the μPD703000 and oscillator.

(b) External clock input

Caution Input the voltage at the CMOS level to the X1 pin.

15. RECOMMENDED SOLDERING CONDITIONS

Solder this product under the following recommended conditions.

For the details of the recommended soldering conditions, refer to Information Document **Semiconductor Device Mounting Technology Manual (C10535E)**.

For soldering methods and soldering conditions other than those recommended, consult NEC.

Table 15-1. Soldering Conditions of Surface Mount Type

μPD703000GC-xx-xxx-7EA : 100-pin plastic QFP (fine pitch) (14 × 14 mm)

μPD703001GC-xx-7EA : 100-pin plastic QFP (fine pitch) (14 × 14 mm)

Soldering Method	Soldering Condition	Symbol of Recommended Condition
Infrared reflow	Package peak temperature: 235°C, Time: 30 seconds max. (210°C min.), Number of times: 2 max., Number of days: 7 ^{Note} (after that, prebaking is necessary at 125°C for 10 hours) <Precaution> Products other than in heat-resistance trays (such as those packaged in a magazine, taping, or non-heat-resistance tray) cannot be baked while they are in their package.	IR35-107-2
VPS	Package peak temperature: 215°C, Time: 40 seconds max. (200°C min.), Number of times: 2 max., Number of days: 7 ^{Note} (after that, prebaking is necessary at 125°C for 10 hours) <Precaution> Products other than in heat-resistance trays (such as those packaged in a magazine, taping, or non-heat-resistance tray) cannot be baked while they are in their package.	VP15-107-2
Partial heating	Pin temperature: 300°C max., Time: 3 seconds max. (per side of device)	—

Note The number of days during which the product can be stored at 25°C, 65% RH max. after the dry pack has been opened.

Caution Do not use two or more soldering methods in combination (except partial heating).

NOTES FOR CMOS DEVICES

① PRECAUTION AGAINST ESD FOR SEMICONDUCTORS

Note: Strong electric field, when exposed to a MOS device, can cause destruction of the gate oxide and ultimately degrade the device operation. Steps must be taken to stop generation of static electricity as much as possible, and quickly dissipate it once, when it has occurred. Environmental control must be adequate. When it is dry, humidifier should be used. It is recommended to avoid using insulators that easily build static electricity. Semiconductor devices must be stored and transported in an anti-static container, static shielding bag or conductive material. All test and measurement tools including work bench and floor should be grounded. The operator should be grounded using wrist strap. Semiconductor devices must not be touched with bare hands. Similar precautions need to be taken for PW boards with semiconductor devices on it.

② HANDLING OF UNUSED INPUT PINS FOR CMOS

Note: No connection for CMOS device inputs can be cause of malfunction. If no connection is provided to the input pins, it is possible that an internal input level may be generated due to noise, etc., hence causing malfunction. CMOS device behave differently than Bipolar or NMOS devices. Input levels of CMOS devices must be fixed high or low by using a pull-up or pull-down circuitry. Each unused pin should be connected to V_{DD} or GND with a resistor, if it is considered to have a possibility of being an output pin. All handling related to the unused pins must be judged device by device and related specifications governing the devices.

③ STATUS BEFORE INITIALIZATION OF MOS DEVICES

Note: Power-on does not necessarily define initial status of MOS device. Production process of MOS does not define the initial operation status of the device. Immediately after the power source is turned ON, the devices with reset function have not yet been initialized. Hence, power-on does not guarantee out-pin levels, I/O settings or contents of registers. Device is not initialized until the reset signal is received. Reset operation must be executed immediately after power-on for devices having reset function.

Regional Information

Some information contained in this document may vary from country to country. Before using any NEC product in your application, please contact the NEC office in your country to obtain a list of authorized representatives and distributors. They will verify:

- Device availability
- Ordering information
- Product release schedule
- Availability of related technical literature
- Development environment specifications (for example, specifications for third-party tools and components, host computers, power plugs, AC supply voltages, and so forth)
- Network requirements

In addition, trademarks, registered trademarks, export restrictions, and other legal issues may also vary from country to country.

No part of this document may be copied or reproduced in any form or by any means without the prior written consent of NEC Corporation. NEC Corporation assumes no responsibility for any errors which may appear in this document.

NEC Corporation does not assume any liability for infringement of patents, copyrights or other intellectual property rights of third parties by or arising from use of a device described herein or any other liability arising from use of such device. No license, either express, implied or otherwise, is granted under any patents, copyrights or other intellectual property rights of NEC Corporation or others.

While NEC Corporation has been making continuous effort to enhance the reliability of its semiconductor devices, the possibility of defects cannot be eliminated entirely. To minimize risks of damage or injury to persons or property arising from a defect in an NEC semiconductor device, customers must incorporate sufficient safety measures in its design, such as redundancy, fire-containment, and anti-failure features.

NEC devices are classified into the following three quality grades:

"Standard", "Special", and "Specific". The Specific quality grade applies only to devices developed based on a customer designated "quality assurance program" for a specific application. The recommended applications of a device depend on its quality grade, as indicated below. Customers must check the quality grade of each device before using it in a particular application.

Standard: Computers, office equipment, communications equipment, test and measurement equipment, audio and visual equipment, home electronic appliances, machine tools, personal electronic equipment and industrial robots

Special: Transportation equipment (automobiles, trains, ships, etc.), traffic control systems, anti-disaster systems, anti-crime systems, safety equipment and medical equipment (not specifically designed for life support)

Specific: Aircrafts, aerospace equipment, submersible repeaters, nuclear reactor control systems, life support systems or medical equipment for life support, etc.

The quality grade of NEC devices is "Standard" unless otherwise specified in NEC's Data Sheets or Data Books. If customers intend to use NEC devices for applications other than those specified for Standard quality grade, they should contact an NEC sales representative in advance.

Anti-radioactive design is not implemented in this product.
