

8-BIT SINGLE-CHIP MICROCONTROLLERS

DESCRIPTION

★ The  $\mu$ PD780053, 780054, 780055, 780056, 780058, and 780058B (hereafter, referred to as  $\mu$ PD78005x) are products of the  $\mu$ PD780058 Subseries in the 78K/0 Series.

★ The  $\mu$ PD780053Y, 780054Y, 780055Y, 780056Y, and 780058BY (hereafter referred to as  $\mu$ PD78005xY) are products of the  $\mu$ PD780058Y Subseries in the 78K/0 Series.

These microcontrollers show a reduction in the EMI (Electro Magnetic Interference) noise generated internally compared to the conventional type, the  $\mu$ PD78054 Subseries. Also they have provided is an 8-bit resolution A/D converter, 8-bit resolution D/A converter, timers, serial interfaces, real-time output ports, interrupt functions, and various other peripheral hardware.

The  $\mu$ PD780058Y Subseries is based on the  $\mu$ PD780058 Subseries but with the addition of an I<sup>2</sup>C bus interface function supporting multi-master.

Flash memory versions, the  $\mu$ PD78F0058 and 78F0058Y and various development tools are also available.

Detailed function descriptions are provided in the following user's manuals. Be sure to read them before designing.

$\mu$ PD780058, 780058Y Subseries User's Manual: U12013E  
 78K/0 Series User's Manual - Instruction: U12326E

FEATURES

Part Number	Item	Program Memory (ROM)	Data Memory		
			Internal High-Speed RAM	Internal Buffer RAM	Internal Expansion RAM
$\mu$ PD780053, 780053Y		24 KB	1,024 bytes	32 bytes	None
$\mu$ PD780054, 780054Y		32 KB			
$\mu$ PD780055, 780055Y		40 KB			
$\mu$ PD780056, 780056Y		48 KB			
★ $\mu$ PD780058B, 780058BY 780058		60 KB			1,024 bytes

- Internal high-capacity ROM & RAM
- External memory expansion space: 64 KB
- Minimum instruction execution time can be changed from high-speed (0.4  $\mu$ s) to ultra-low-speed (122  $\mu$ s)
- I/O ports: 68 (N-ch open-drain: 4)
- 8-bit resolution A/D converter: 8 channels ( $V_{DD} = 1.8$  to  $5.5 V^{Note}$ )
- 8-bit resolution D/A converter: 2 channels ( $V_{DD} = 1.8$  to  $5.5 V^{Note}$ )
- Serial interface: 3 channels
- Timer: 5 channels
- Supply voltage:  $V_{DD} = 1.8$  to  $5.5 V$

Note The operation voltage of the A/D converter and D/A converter of the  $\mu$ PD780058 is  $V_{DD} = 2.7$  to  $5.5 V$ .

The information in this document is subject to change without notice. Before using this document, please confirm that this is the latest version.  
 Not all devices/types available in every country. Please check with local NEC representative for availability and additional information.

**APPLICATIONS**

Car audio systems, cellular phones, pagers, printers, AV equipment, cameras, PPCs, vending machines, etc.

★ 78K/0 SERIES LINEUP

The products in the 78K/0 Series are listed below. The names enclosed in boxes are subseries name.

78K/0 Series	Control			
	100-pin	μPD78075B	EMI-noise reduced version of the μPD78078	
	100-pin	μPD78078	μPD78078Y	μPD78054 with timer and enhanced external interface
	100-pin	μPD78070A	μPD78070AY	ROMless version of the μPD78078
	100-pin		μPD780018AY	μPD78078Y with enhanced serial I/O and limited function
	80-pin	μPD780058	μPD780058Y	μPD78054 with enhanced serial I/O
	80-pin	μPD78058F	μPD78058FY	EMI-noise reduced version of the μPD78054
	80-pin	μPD78054	μPD78054Y	μPD78018F with UART and D/A converter, and enhanced I/O
	80-pin	μPD780065		μPD780024A with expanded RAM
	64-pin	μPD780078	μPD780078Y	μPD780034A with timer and enhanced serial I/O
	64-pin	μPD780034A	μPD780034AY	μPD780024A with enhanced A/D converter
	64-pin	μPD780024A	μPD780024AY	μPD78018F with enhanced serial I/O
	64-pin	μPD78014H		EMI-noise reduced version of the μPD78018F
	64-pin	μPD78018F	μPD78018FY	Basic subseries for control
	42/44-pin	μPD78083		On-chip UART, capable of operating at low voltage (1.8 V)
	Inverter control			
	64-pin	μPD780988		On-chip inverter control circuit and UART. EMI-noise reduced.
	VFD drive			
	100-pin	μPD780208		μPD78044F with enhanced I/O and VFD C/D. Display output total: 53
	80-pin	μPD780232		For panel control. On-chip VFD C/D. Display output total: 53
80-pin	μPD78044H		μPD78044F with N-ch open-drain I/O. Display output total: 34	
80-pin	μPD78044F		Basic subseries for driving VFD. Display output total: 34	
LCD drive				
120-pin	μPD780338		μPD780308 with enhanced display function and timer. Segment signal output: 40 pins max.	
120-pin	μPD780328		μPD780308 with enhanced display function and timer. Segment signal output: 32 pins max.	
120-pin	μPD780318		μPD780308 with enhanced display function and timer. Segment signal output: 24 pins max.	
100-pin	μPD780308	μPD780308Y	μPD78064 with enhanced SIO, and expanded ROM and RAM	
100-pin	μPD78064B		EMI-noise reduced version of the μPD78064	
100-pin	μPD78064	μPD78064Y	Basic subseries for driving LCDs, on-chip UART	
Bus interface supported				
100-pin	μPD780948		On-chip CAN controller	
80-pin	μPD78098B		μPD78054 with IEBus™ controller.	
80-pin		μPD780702Y	On-chip IEBus controller	
80-pin		μPD780703Y	On-chip CAN controller	
80-pin		μPD780833Y	On-chip controller compliant with J1850 (Class 2)	
64-pin	μPD780816		Specialized for CAN controller function	
Meter control				
100-pin	μPD780958		For industrial meter control	
80-pin	μPD780852		On-chip automobile meter controller/driver	
80-pin	μPD780828B		For automobile meter driver. On-chip DCAN controller	

**Remark** VFD (Vacuum Fluorescent Display) is referred to as FIP™ (Fluorescent Indicator Panel) in some documents, but the functions of the two are the same.

- Cautions**
1. Connect the IC (Internally Connected) pin directly to V<sub>SS0</sub> or V<sub>SS1</sub>.
  2. Connect the AV<sub>SS</sub> pin to V<sub>SS0</sub>.

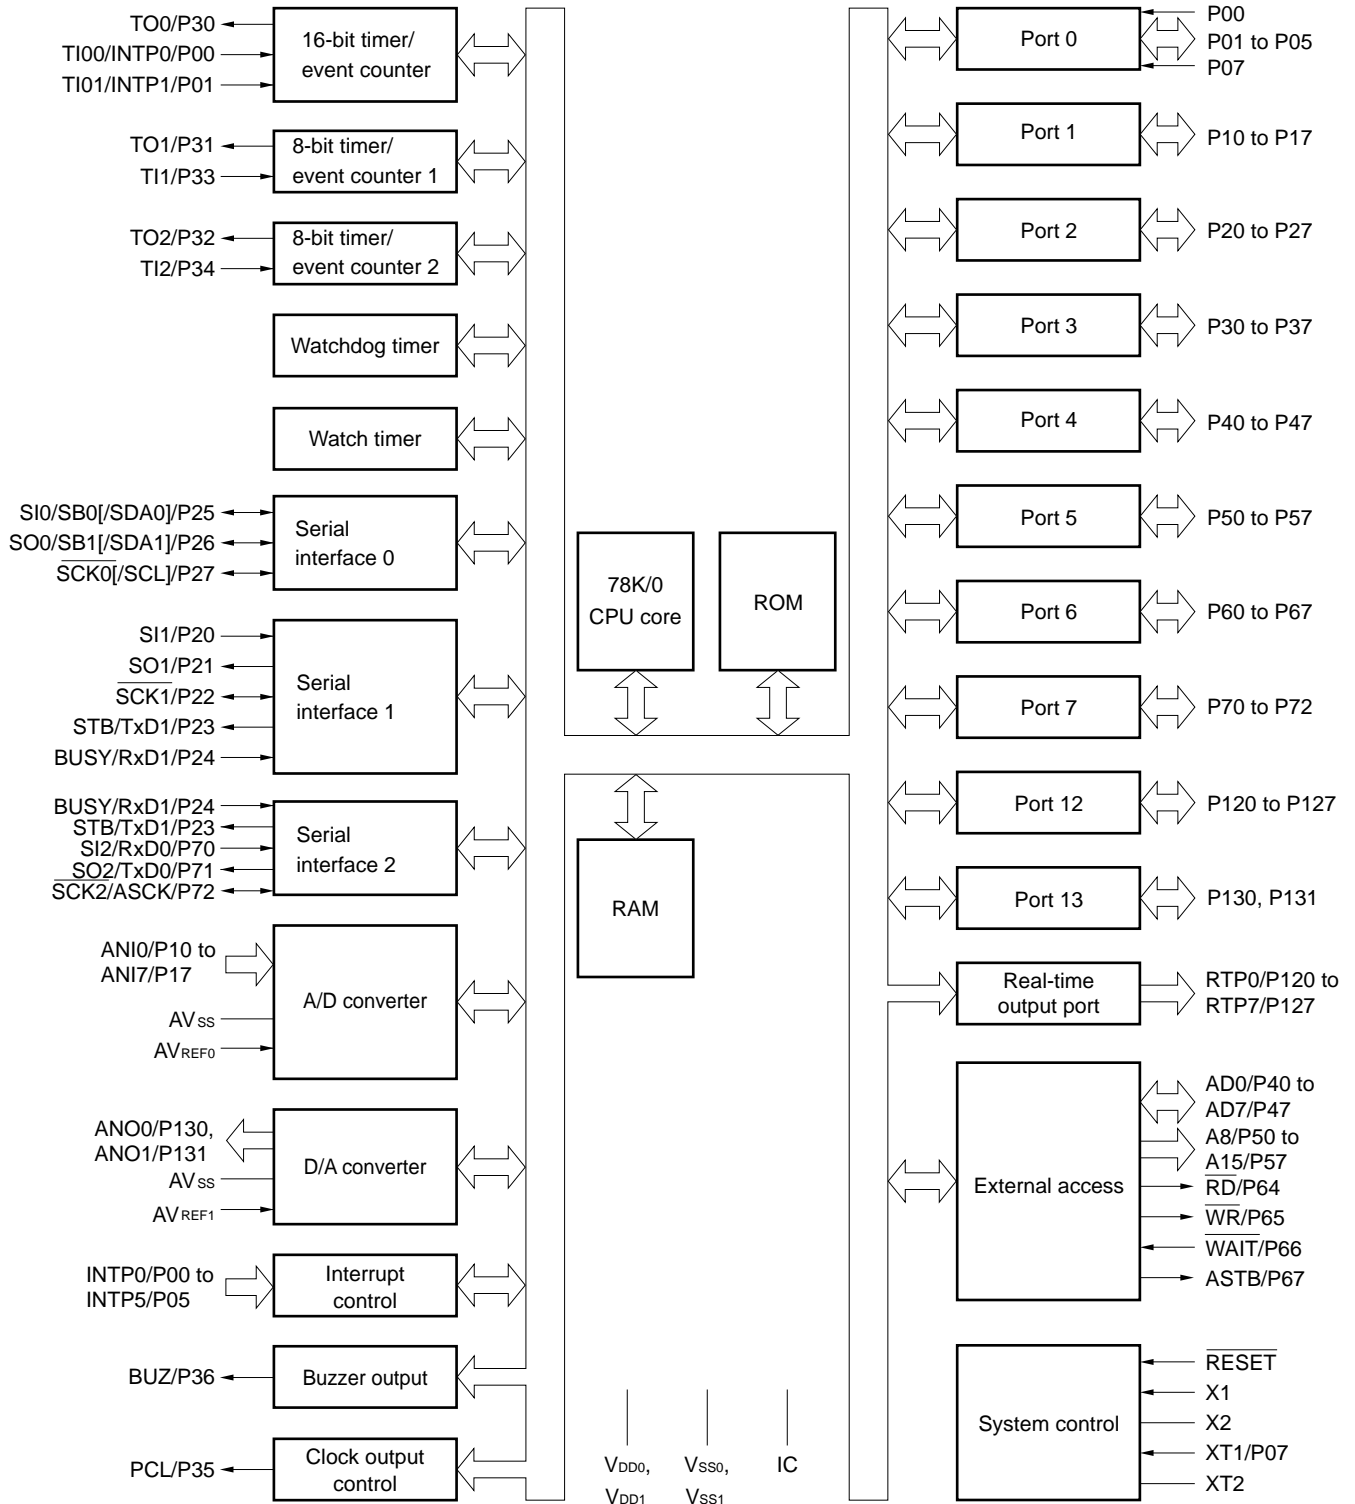

- Remarks**
1. [ ]: μPD78005xY only
  2. When the microcontroller is used in applications where the noise generated inside the microcontroller needs to be reduced, the implementation of noise reduction measures, such as supplying voltage to V<sub>DD0</sub> and V<sub>DD1</sub> individually and connecting V<sub>SS0</sub> and V<sub>SS1</sub> to different ground lines, is recommended.

## PIN IDENTIFICATION

A8 to A15:	Address bus	PCL:	Programmable clock
AD0 to AD7:	Address/data bus	$\overline{RD}$ :	Read strobe
ANI0 to ANI7:	Analog input	$\overline{RESET}$ :	Reset
ANO0, ANO1:	Analog output	RTP0 to RTP7:	Real-time output port
ASCK:	Asynchronous serial clock	RxD0, RxD1:	Receive data
ASTB:	Address strobe	SB0, SB1:	Serial bus
AVREF0, AVREF1:	Analog reference voltage	$\overline{SCK0}$ to $\overline{SCK2}$ :	Serial clock
AVSS:	Analog ground	SCL:	Serial clock

## 5. PERIPHERAL HARDWARE FUNCTION FEATURES

### 5.1 Ports

The following three types of I/O ports are available.

• CMOS input (P00, P07):	2
• CMOS I/O (P01 to P05, port 1 to port 5, P64 to P67, port 7, port 12, port 13):	62
• N-ch open-drain I/O (P60 to P63):	4
Total:	68

**Table 5-1. Port Functions**

Port Name	Pin Name	Function
Port 0	P00, P07	Input only
	P01 to P05	I/O port. Input/output can be specified in 1-bit units. When used as an input port, an on-chip pull-up resistor can be specified by software.
Port 1	P10 to P17	I/O port. Input/output can be specified in 1-bit units. When used as an input port, an on-chip pull-up resistor can be specified by software.
Port 2	P20 to P27	I/O port. Input/output can be specified in 1-bit units. When used as an input port, an on-chip pull-up resistor can be specified by software.
Port 3	P30 to P37	I/O port. Input/output can be specified in 1-bit units. When used as an input port, an on-chip pull-up resistor can be specified by software.
Port 4	P40 to P47	I/O port. Input/output can be specified in 8-bit units. When used as an input port, an on-chip pull-up resistor can be specified by software. The test flag (KRIF) is set to 1 by falling edge detection.
Port 5	P50 to P57	I/O port. Input/output can be specified in 1-bit units. When used as an input port, an on-chip pull-up resistor can be specified by software. LEDs can be driven directly.
Port 6	P60 to P63	N-ch open-drain I/O port. Input/output can be specified in 1-bit units. On-chip pull-up resistor can be used by mask option. LEDs can be driven directly.
	P64 to P67	I/O port. Input/output can be specified in 1-bit units. When used as an input port, an on-chip pull-up resistor can be specified by software.
Port 7	P70 to P72	I/O port. Input/output can be specified in 1-bit units. When used as an input port, an on-chip pull-up resistor can be specified by software.
Port 12	P120 to P127	I/O port. Input/output can be specified in 1-bit units. When used as an input port, an on-chip pull-up resistor can be specified by software.
Port 13	P130, P131	I/O port. Input/output can be specified in 1-bit units. When used as an input port, an on-chip pull-up resistor can be specified by software.

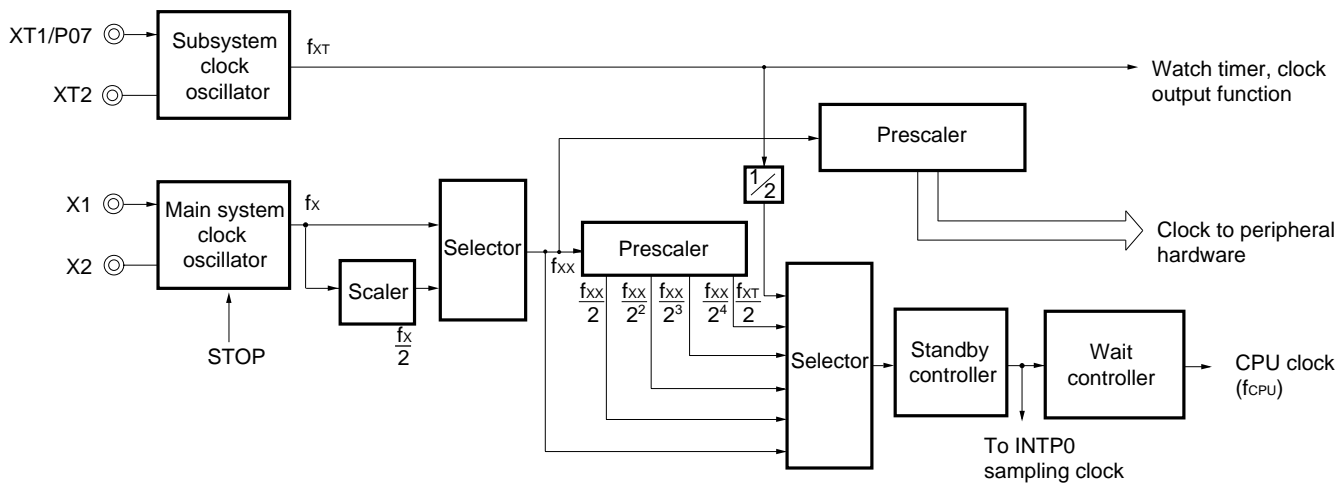

### 5.2 Clock Generator

Two types of generators, a main system clock generator and a subsystem clock generator, are available.

The minimum instruction execution time can be changed.

- 0.4 μs/0.8 μs/1.6 μs/3.2 μs/6.4 μs/12.8 μs (@5.0 MHz operation with main system clock)
- 122 μs (@32.768 kHz operation with subsystem clock)

### 5.3 Timer/Event Counter

Five timer/event counter channels are incorporated.

- 16-bit timer/event counter: 1 channel
- 8-bit timer/event counter: 2 channels
- Watch timer: 1 channel
- Watchdog timer: 1 channel

Table 5-2. Operations of Timer/Event Counter

### 5.5 Buzzer Output Controller

Clocks with the following frequencies can be output as the buzzer output.

- 1.2 kHz/2.4 kHz/4.9 kHz/9.8 kHz (@5.0 MHz operation with main system clock)

Figure 5-7. Block Diagram of Buzzer Output Controller

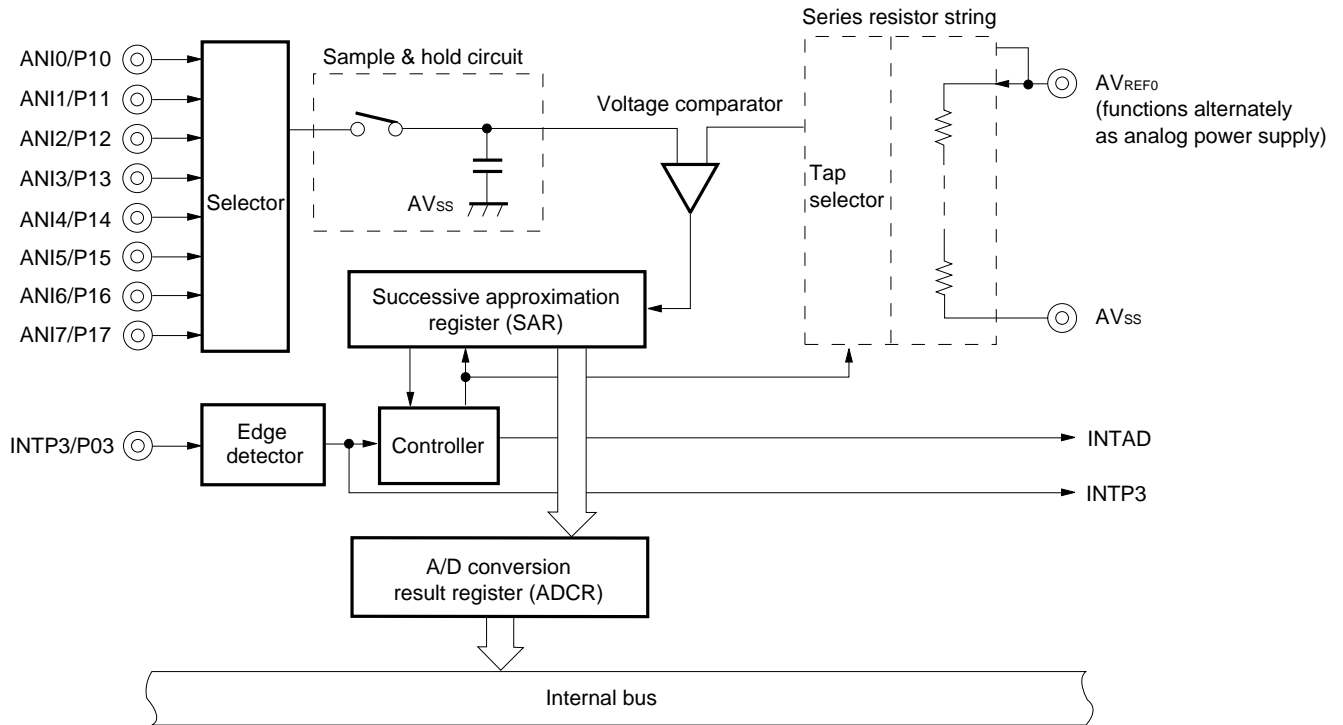

### 5.6 A/D Converter

An A/D converter consists of eight 8-bit resolution channels is incorporated.

The following two types of the A/D conversion operation startup methods are available.

- Hardware start
- Software start

Figure 5-8. Block Diagram of A/D Converter

### 5.7 D/A Converter

A D/A converter consisting of two 8-bit resolution channels is incorporated.  
The conversion method is the R-2R resistor ladder method.

n = 0, 1  
m = 4, 5  
x = 1, 2

### 5.8 Serial Interfaces

Three clocked serial interface channels are incorporated.

- Serial interface channel 0
- Serial interface channel 1
- Serial interface channel 2

**Table 5-3. Types and Functions of Serial Interface**

Function	Serial Interface Channel 0		Serial Interface Channel 1	Serial Interface Channel 2

### 5.9 Real-Time Output Ports

Data set previously in the real-time output buffer register is transferred to the output latch by hardware concurrently with timer interrupt request and external interrupt request generation in order to output off-chip. This is the real-time output function. Pins used to output off-chip are called real-time output ports.

By using a real-time output port, a signal with no jitter can be output. This is most applicable to control of stepper motors, etc.

Figure 5-13. Block Diagram of Real-Time Output Port

## 6. INTERRUPT AND TEST FUNCTIONS

### 6.1 Interrupt Functions

The interrupt function includes, three different kinds of interrupts from 21 sources, as shown below.

- Non-maskable: 1
- Maskable: 19
- Software: 1

**Table 6-1. Interrupt Source List (1/2)**

Interrupt Type	Note 1 Default Priority	Interrupt Source		Internal/ External	Vector Table Address	Basic Configuration Type <sup>Note 2</sup>		
		Name	Trigger					
Non-maskable	–	INTWDT	Watchdog timer overflow (with watchdog timer mode 1 selected)	Internal	0004H	(A)		
Maskable	0	INTWDT	Watchdog timer overflow (with interval timer mode selected)			External	0006H	(B)
	1	INTP0	Pin input edge detection	0008H	(C)			
	2	INTP1			(D)			
	3	INTP2						
	4	INTP3						
	5	INTP4						
	6	INTP5						
	7	INTCS10						End of serial interface channel 0 transfer
	8	INTCS11	End of serial interface channel 1 transfer	0016H				
	9	INTSER	Occurrence of serial interface channel 2 UART reception error	0018H				
	10	INTSR	End of serial interface channel 2 UART reception	001AH				
INTCS12		End of serial interface channel 2 3-wire transfer						
11	INTST	End of serial interface channel 2 UART transmission	001CH					

**Notes 1.** Default priority is the priority order when several maskable interrupt requests are generated simultaneously. 0 is the highest order and 17 is the lowest.

**2.** Basic configuration types (A) to (E) correspond to (A) to (E) in Figure 6-1.

**Remark** There are two types of interrupt source for the watchdog timer: Non-maskable interrupts and maskable interrupts (internal). Only one of these interrupts can be selected.

Table 6-1. Interrupt Source List (2/2)

Interrupt Type	Note 1 Default Priority	Interrupt Source		Internal/ External	Vector Table Address	Basic Configuration Type <sup>Note 2</sup>
		Name	Trigger			
Maskable	12	INTTM3	Reference time interval signal from watch timer	Internal	001EH	(B)
	13	INTTM00	Generation of match signal of 16-bit timer counter and capture/compare register (CR00)		0020H	
	14	INTTM01	Generation of match signal of 16-bit timer counter and capture/compare register (CR01)		0022H	
	15	INTTM1	Generation of match signal of 8-bit timer/event counter 1		0024H	
	16	INTTM2	Generation of match signal of 8-bit timer/event counter 2		0026H	
	17	INTAD	End of conversion by A/D converter		0028H	
Software	–	BRK	Execution of BRK instruction	–	003EH	(E)

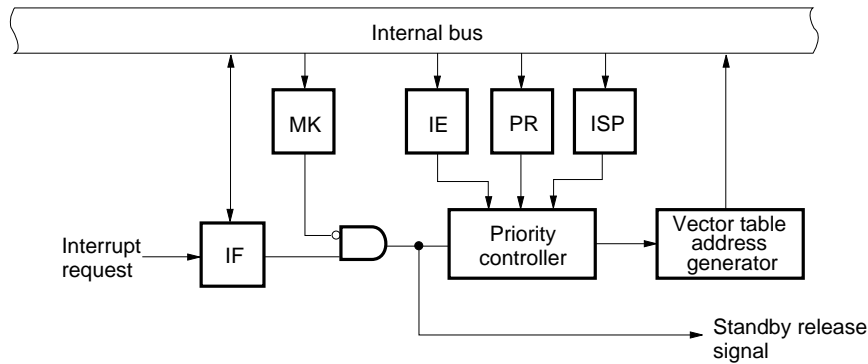

- Notes**
1. Default priority is the priority order when several maskable interrupt requests are generated simultaneously. 0 is the highest order and 17 is the lowest.
  2. Basic configuration types (A) to (E) correspond to (A) to (E) in Figure 6-1.

### 6.2 Test Functions

The test function includes the two test input sources shown in Table 6-2 below.

**Table 6-2. Test Input Source List**

Test Input Source		Internal/External
Name	Trigger	
INTWT	Watch timer overflow	Internal
INTPT4	Port 4 falling edge detection	External

## 7. EXTERNAL DEVICE EXPANSION FUNCTION

The external device expansion function connects external devices to areas other than the internal ROM, RAM, and SFR areas.

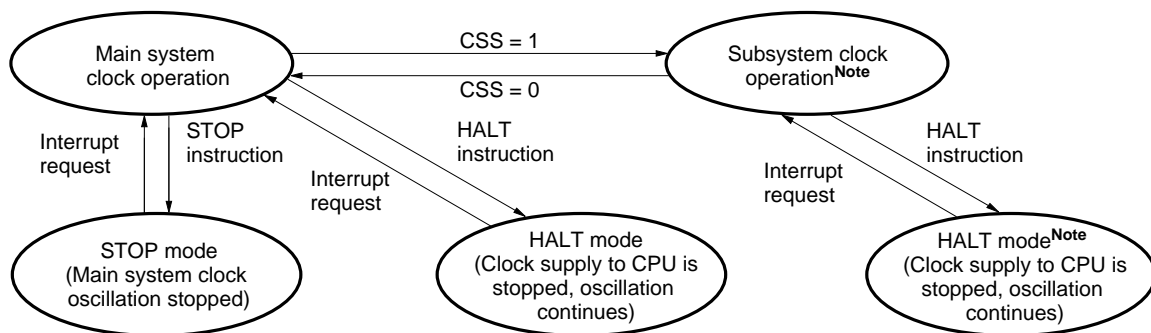

Ports 4 to 6 are used for external device connection.

## 8. STANDBY FUNCTION

The following two standby functions are available for further reduction of system current consumption.

- **HALT mode:** In this mode, the CPU operating clock is stopped. The average current consumption can be reduced by intermittent operation by combining this mode with the normal operation mode.
- **STOP mode:** In this mode oscillation of the main system clock is stopped. All the operations performed on the main system clock are suspended, and only the subsystem clock is used, resulting in extremely small power consumption.

Figure 8-1. Standby Function

**Note** The current consumption can be reduced by stopping the main system clock.

When the CPU is operating on the subsystem clock, set the MCC (bit 7 of the processor clock control register (PCC)) to stop the main system clock. The STOP instruction cannot be used.

**Caution** When the main system clock is stopped and the system is operating on the subsystem clock, wait until the oscillation stabilization time has been secured by the program before switching back to the main system clock.

**Remark** CSS: Bit 4 of the processor clock control register (PCC).

## 9. RESET FUNCTION

The following two reset methods are available.

- External reset by  $\overline{\text{RESET}}$  signal input
- Internal reset by watchdog timer program loop time detection

## 10. MASK OPTION

The  $\mu$ PD78005x and 78005xY have the following mask options.

- Pull-up resistor

An on-chip pull-up resistor for P60 to P63 (I/O port) can be specified in 1-bit units.

<1> Specifies on-chip pull-up resistor.

<2> Does not specify on-chip pull-up resistor.

11. INSTRUCTION SET

(1) 8-bit instructions

**Caution** Product quality may suffer if the absolute maximum rating is exceeded even momentarily for any parameter. That is, the absolute maximum ratings are rated values at which the product is on the verge of suffering physical damage, and therefore the product must be used under conditions that ensure that the absolute maximum ratings are not exceeded.

- Notes**
1. Indicates only oscillator characteristics. Refer to **AC Characteristics** for instruction execution time.
  2. Time required to stabilize oscillation after reset or STOP mode release.

**Cautions** 1. When using the main system clock oscillator, wire as follows in the area enclosed by the broken lines in the above figures to avoid an adverse effect from wiring capacitance.

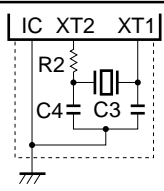

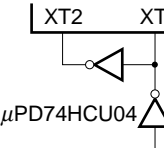

- Keep the wiring length as short as possible.
- Do not cross the wiring with the other signal lines.
- Do not route the wiring near a signal line through which a high fluctuating current flows.
- Always make the ground point of the oscillator capacitor the same potential as V<sub>SS1</sub>.
- Do not ground the capacitor to a ground pattern through which a high current flows.
- Do not fetch signals from the oscillator.

2. When the main system clock is stopped and the system is operating on the subsystem clock, wait until the oscillation stabilization time has been secured by the program before switching back to the main system clock.

**Remark** For the resonator selection and oscillator constant, customers are requested to either evaluate the oscillation themselves or apply to the resonator manufacturer for evaluation.

**Subsystem Clock Oscillator Characteristics (T<sub>A</sub> = -40 to +85°C, V<sub>DD</sub> = 1.8 to 5.5 V)**

		XT1 input high-/low-level width (t <sub>XTH</sub> , t <sub>XTL</sub> )		5		15	μs

- Notes**
1. Indicates only oscillator characteristics. Refer to **AC Characteristics** for instruction execution time.
  2. Time required to stabilize oscillation after V<sub>DD</sub> reaches oscillation voltage MIN.

**Cautions** 1. When using the subsystem clock oscillator, wire as follows in the area enclosed by the broken lines in the above figures to avoid an adverse effect from wiring capacitance.

- Keep the wiring length as short as possible.
- Do not cross the wiring with the other signal lines.
- Do not route the wiring near a signal line through which a high fluctuating current flows.
- Always make the ground point of the oscillator capacitor the same potential as V<sub>SS1</sub>.
- Do not ground the capacitor to a ground pattern through which a high current flows.
- Do not fetch signals from the oscillator.

2. The subsystem clock oscillator is designed as a low-amplitude circuit for reducing current consumption, and is more prone to malfunction due to noise than the main system clock oscillator. Particular care is therefore required with the wiring method when the subsystem clock is used.

**Remark** For the resonator selection and oscillator constant, customers are requested to either evaluate the oscillation themselves or apply to the resonator manufacturer for evaluation.

**15. RECOMMENDED SOLDERING CONDITIONS**

The μPD78005x and 78005xY should be soldered and mounted under the following recommended conditions.

For details of the recommended soldering conditions, refer to the document **Semiconductor Device Mounting Technology Manual (C10535E)**.

For soldering methods and conditions other than those recommended below, contact an NEC sales representative.

**APPENDIX A. DEVELOPMENT TOOLS**

The following development tools are available for system development using the μPD780058 and 780058Y Subseries. Also, refer to **(6) Cautions on using development tools.**

**(1) Software package**

SP78K0	CD-ROM that integrates the development tools (software) common to the 78K/0 Series in one package
--------	---

**(2) Language processing software**

RA78K0	Assembler package common to the 78K/0 Series
CC78K0	C compiler package common to the 78K/0 Series
DF780058	Device file for the μPD780058, 780058Y Subseries
CC78K0-L	C compiler library source file common to the 78K/0 Series

**(3) Flash memory writing tools**

Flashpro III (Part number: FL-PR3, PG-FL3)	Dedicated flash programmer for microcontrollers incorporating flash memory
FA-80GC-8BT FA-80GK-9EU	Adapter for flash memory writing

**(4) Debugging tools**

- **When using the IE-78K0-NS, IE-78K0-NS-A in-circuit emulator**

IE-78K0-NS	In-circuit emulator common to the 78K/0 Series
IE-78K0-NS-PA	Performance board to enhance and expand the functions of the IE-78K0-NS
IE-78K0-NS-A	In-circuit emulator that combines IE-78K0-NS and IE-78K0-NS-PA
IE-70000-MC-PS-B	Power supply unit for IE-78K0-NS and IE-78K0-NS-A
IE-70000-98-IF-C	Interface adapter used when a PC-9800 series PC (except notebook types) is used as the host machine (C bus supported)
IE-70000-CD-IF-A	PC card and interface cable used when a PC-9800 series notebook-types PC is used as the host machine (PCMCIA socket supported)
IE-70000-PC-IF-C	Adapter necessary when an IBM PC/AT™ or compatible is used as the host machine (ISA bus supported)
IE-70000-PCI-IF-A	Interface adapter necessary when using a PC with PCI bus as the host machine
IE-780308-NS-EM1	Emulation board common to the μPD780308 Subseries
NP-80GC	Emulation probe for 80-pin plastic QFP (GC-8BT type)
NP-80GK	Emulation probe for 80-pin plastic TQFP (GK-9EU type)
TGK-080SDW	Conversion adapter to connect the NP-80GK and a target system board 80-pin plastic TQFP (GK-9EU type) can be mounted
EV-9200GC-80	Socket to be mounted on a target system board made for 80-pin plastic QFP (GC-8BT type)
ID78K0-NS	Integrated debugger for IE-78K0-NS
SM78K0	System simulator common to the 78K/0 Series

• When using the IE-78001-R-A in-circuit emulator

IE-78001-R-A	In-circuit emulator common to the 78K/0 Series
IE-70000-98-IF-C	Adapter used when PC-9800 series PC (except notebook type) is used as host machine (C bus supported)
IE-70000-PC-IF-C	Interface adapter when using IBM PC/AT or compatible as host machine (ISA bus supported)
IE-780308-R-EM	Emulation board common to the μPD780308 Subseries
EP-78230GC-R	Emulation probe for 80-pin plastic QFP (GC-8BT type)
EP-78054GK-R	Emulation probe for 80-pin plastic TQFP (GK-9EU type)
TGK-080SDW	Conversion adapter to connect the EP-78054GK-R and a target system on which an 80-pin plastic TQFP (GK-9EU type) can be mounted
EV-9200GC-80	Socket to be mounted on a target system board made for 80-pin plastic QFP (GC-8BT type)
ID78K0	Integrated debugger for IE-78001-R-A
SM78K0	78K/0 Series common system simulator
DF780058	Device file for the μPD780058, 780058Y Subseries

(5) Real-time OS

RX78K0	Real-time OS for the 78K/0 Series
--------	-----------------------------------

(6) Cautions on using development tools

- The ID78K0-NS, ID78K0, and SM78K0 are used in combination with the DF780058.
- The CC78K0 and RX78K0 are used in combination with the RA78K0 and DF780058.
- The FL-PR3, FA-80GC-8BT, FA80GK-9EU, NP-80GC, and NP-80GK are products of Naito Densai Machida Mfg. Co., Ltd. (TEL: +81-45-475-4191).
- ★ TGK-080SDW is a product made by TOKYO ELETECH CORPORATION.

**NOTES FOR CMOS DEVICES****① PRECAUTION AGAINST ESD FOR SEMICONDUCTORS**

Note:

Strong electric field, when exposed to a MOS device, can cause destruction of the gate oxide and ultimately degrade the device operation. Steps must be taken to stop generation of static electricity as much as possible, and quickly dissipate it once, when it has occurred. Environmental control must be adequate. When it is dry, humidifier should be used. It is recommended to avoid using insulators that easily build static electricity. Semiconductor devices must be stored and transported in an anti-static container, static shielding bag or conductive material. All test and measurement tools including work bench and floor should be grounded. The operator should be grounded using wrist strap. Semiconductor devices must not be touched with bare hands. Similar precautions need to be taken for PW boards with semiconductor devices on it.

**② HANDLING OF UNUSED INPUT PINS FOR CMOS**

Note:

No connection for CMOS device inputs can be cause of malfunction. If no connection is provided to the input pins, it is possible that an internal input level may be generated due to noise, etc., hence causing malfunction. CMOS devices behave differently than Bipolar or NMOS devices. Input levels of CMOS devices must be fixed high or low by using a pull-up or pull-down circuitry. Each unused pin should be connected to  $V_{DD}$  or GND with a resistor, if it is considered to have a possibility of being an output pin. All handling related to the unused pins must be judged device by device and related specifications governing the devices.

**③ STATUS BEFORE INITIALIZATION OF MOS DEVICES**

Note:

Power-on does not necessarily define initial status of MOS device. Production process of MOS does not define the initial operation status of the device. Immediately after the power source is turned ON, the devices with reset function have not yet been initialized. Hence, power-on does not guarantee out-pin levels, I/O settings or contents of registers. Device is not initialized until the reset signal is received. Reset operation must be executed immediately after power-on for devices having reset function.

Purchase of NEC I<sup>2</sup>C components conveys a license under the Philips I<sup>2</sup>C Patent Rights to use these components in an I<sup>2</sup>C system, provided that the system conforms to the I<sup>2</sup>C Standard Specification as defined by Philips.

## Regional Information

Some information contained in this document may vary from country to country. Before using any NEC product in your application, please contact the NEC office in your country to obtain a list of authorized representatives and distributors. They will verify:

- Device availability
- Ordering information
- Product release schedule
- Availability of related technical literature
- Development environment specifications (for example, specifications for third-party tools and components, host computers, power plugs, AC supply voltages, and so forth)
- Network requirements

In addition, trademarks, registered trademarks, export restrictions, and other legal issues may also vary from country to country.

The export of this product from Japan is regulated by the Japanese government. To export this product may be prohibited without governmental license, the need for which must be judged by the customer. The export or re-export of this product from a country other than Japan may also be prohibited without a license from that country. Please call an NEC sales representative.

• **The information in this document is current as of August, 2001. The information is subject to change without notice. For actual design-in, refer to the latest publications of NEC's data sheets or data books, etc., for the most up-to-date specifications of NEC semiconductor products. Not all products and/or types are available in every country. Please check with an NEC sales representative for availability and additional information.**

- No part of this document may be copied or reproduced in any form or by any means without prior written consent of NEC. NEC assumes no responsibility for any errors that may appear in this document.
- NEC does not assume any liability for infringement of patents, copyrights or other intellectual property rights of third parties by or arising from the use of NEC semiconductor products listed in this document or any other liability arising from the use of such products. No license, express, implied or otherwise, is granted under any patents, copyrights or other intellectual property rights of NEC or others.
- Descriptions of circuits, software and other related information in this document are provided for illustrative purposes in semiconductor product operation and application examples. The incorporation of these circuits, software and information in the design of customer's equipment shall be done under the full responsibility of customer. NEC assumes no responsibility for any losses incurred by customers or third parties arising from the use of these circuits, software and information.
- While NEC endeavours to enhance the quality, reliability and safety of NEC semiconductor products, customers agree and acknowledge that the possibility of defects thereof cannot be eliminated entirely. To minimize risks of damage to property or injury (including death) to persons arising from defects in NEC semiconductor products, customers must incorporate sufficient safety measures in their design, such as redundancy, fire-containment, and anti-failure features.
- NEC semiconductor products are classified into the following three quality grades:  
"Standard", "Special" and "Specific". The "Specific" quality grade applies only to semiconductor products developed based on a customer-designated "quality assurance program" for a specific application. The recommended applications of a semiconductor product depend on its quality grade, as indicated below. Customers must check the quality grade of each semiconductor product before using it in a particular application.  
"Standard": Computers, office equipment, communications equipment, test and measurement equipment, audio and visual equipment, home electronic appliances, machine tools, personal electronic equipment and industrial robots  
"Special": Transportation equipment (automobiles, trains, ships, etc.), traffic control systems, anti-disaster systems, anti-crime systems, safety equipment and medical equipment (not specifically designed for life support)  
"Specific": Aircraft, aerospace equipment, submersible repeaters, nuclear reactor control systems, life support systems and medical equipment for life support, etc.

The quality grade of NEC semiconductor products is "Standard" unless otherwise expressly specified in NEC's data sheets or data books, etc. If customers wish to use NEC semiconductor products in applications not intended by NEC, they must contact an NEC sales representative in advance to determine NEC's willingness to support a given application.

(Note)

- (1) "NEC" as used in this statement means NEC Corporation and also includes its majority-owned subsidiaries.
- (2) "NEC semiconductor products" means any semiconductor product developed or manufactured by or for NEC (as defined above).
