

8-BIT SINGLE-CHIP MICROCONTROLLER

DESCRIPTION

Compared to the μ PD78018F (standard model), the μ PD78018F(A) employs a stricter quality-assurance program. (NEC calls this quality grade "special grade").

The μ PD78018F(A) is a product in the μ PD78018F subseries within the 78K/0 series.

Compared with the older μ PD78014 subseries, this subseries operates at lower voltage and provides a fuller set of ROM and RAM variations.

A one-time PROM model μ PD78P018F(A) capable of operating in the same power supply voltage as of the mask ROM product and other development tools are also provided.

Functions are described in detail in the following User's Manual, which should be read when carrying out design work.

μ PD78018F, 78018FY Subseries User's Manual : U10659E

78K/0 Series User's Manual – Instruction : U12326E

FEATURES

- Large on-chip ROM & RAM

Item Product Name	Program Memory (ROM)	Data Memory			Package
		Internal High-Speed RAM	Internal Expanded RAM	Buffer RAM	
μ PD78011F(A)	8K bytes	512 bytes	–	32 bytes	<ul style="list-style-type: none"> • 64-pin plastic shrink DIP (750 mil) • 64-pin plastic QFP (14 × 14 mm)

μ PD78015F(A)	40K bytes				
μ PD78016F(A)	48K bytes	1024 bytes			
μ PD78018F(A)	60K bytes				

- External memory expansion space: 64K bytes
- Minimum instruction execution time can be varied from high-speed (0.4 μ s) to ultra-low-speed (122 μ s)
- I/O ports: 53 (N-ch open-drain: 4)
- 8-bit resolution A/D converter: 8 channels
- Serial interface: 2 channels
- Timer: 5 channels
- Supply voltage: $V_{DD} = 1.8$ to 5.5 V

In addition to the μ PD78011F(A), 78012F(A), 78013F(A), 78014(A), 78015F(A), 78016F(A), and 78018F(A), this document also describes μ PD78012F(A2). However, unless otherwise specified, the μ PD78018F(A) is treated as the representative model throughout this document.

The information in this document is subject to change without notice.

APPLICATION

Control unit of automotive, gas leak breaker, and safety devices, etc.

5.2 CLOCK GENERATOR

There are two types of clock generator: main system clock and subsystem clock.
 The minimum instruction execution time can be changed.

- 0.4 μ s/0.8 μ s/1.6 μ s/3.2 μ s/6.4 μ s (Main system clock: at 10.0 MHz operation)
- 122 μ s (Subsystem clock: at 32.768 KHz operation)

5.3 TIMER/EVENT COUNTER

The following five channels are incorporated in the timer/event counter.

- 16-bit timer/event counter : 1 channel
- 8-bit timer/event counter : 2 channels
- Watch timer : 1 channel
- Watchdog timer : 1 channel

5.6 A/D CONVERTER

The A/D converter has on-chip eight 8-bit resolution channels.
There are the following two method to start A/D conversion.

- Hardware starting
- Software starting

Figure 5-8. A/D Converter Block Diagram

5.7 SERIAL INTERFACES

There are two on-chip clocked serial interfaces as follows.

- Serial Interface channel 0
- Serial Interface channel 1

Table 5-3. Type and Function of Serial Interface

Function	Serial Interface Channel 0	Serial Interface Channel 1

6. INTERRUPT FUNCTIONS AND TEST FUNCTIONS

6.1 INTERRUPT FUNCTIONS

There are the 14 interrupt sources of 3 different kind as shown below.

- Non-maskable : 1
- Maskable : 12
- Software : 1

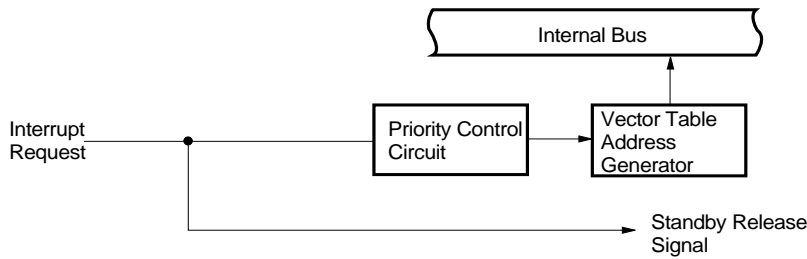

Table 6-1. Interrupt Source List

Interrupt Type	Default Priority ^{Note 1}	Interrupt Source		Internal/ External	Vector Table Address	Basic Configuration Type ^{Note 2}

7. EXTERNAL DEVICE EXPANSION FUNCTIONS

The external device expansion function is used to connect external devices to areas other than the internal ROM, RAM and SFR.

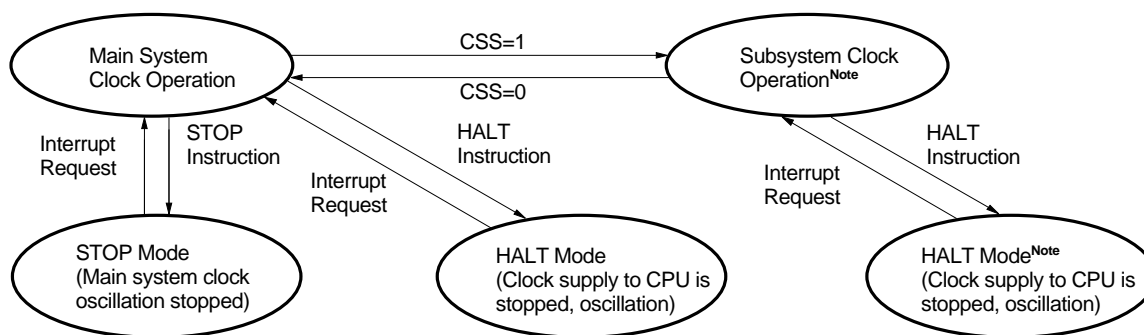

Ports 4 to 6 are used for connection with external devices.

8. STANDBY FUNCTIONS

There are the following two standby functions to reduce the current consumption.

- HALT mode : The CPU operating clock is stopped. The average consumption current can be reduced by intermittent operation in combination with the normal operating mode.
- STOP mode : The main system clock oscillation is stopped. The whole operation by the main system clock is stopped, so that the system operates with ultra-low power consumption using only the subsystem clock.

Figure 8-1. Standby Functions

Note The current consumption can be reduced by stopping the main system clock. When the CPU is operating on the subsystem clock, set bit 7 (MCC) of the processor clock control register (PCC) to stop the main system clock. The STOP instruction cannot be used.

Caution When the main system clock is stopped and the system is operated by the subsystem clock, the subsystem clock should be switched again to the main system clock after the oscillation stabilization time is secured by the program.

9. RESET FUNCTIONS

There are the following two reset methods.

- External reset input by $\overline{\text{RESET}}$ pin.
- Internal reset by watchdog timer hung-up time detection.

10. INSTRUCTION SET

(1) 8-Bit Instruction

Notes 1. Indicates only oscillation circuit characteristics. Refer to **AC Characteristics** for instruction execution time.

2. Time required to stabilize oscillation after reset or STOP mode release.

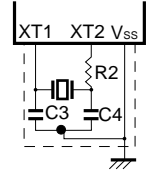

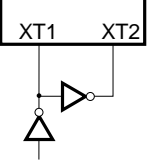

Cautions 1. When using the main system clock oscillator, wiring in the area enclosed with the dotted line should be carried out as follows to avoid an adverse effect from wiring capacitance.

- Wiring should be as short as possible.
- Wiring should not cross other signal lines.
- Wiring should not be placed close to a varying high current.
- The potential of the oscillator capacitor ground should be the same as V_{SS}.
- Do not ground wiring to a ground pattern in which a high current flows.
- Do not fetch a signal from the oscillator.

2. When the main system clock is stopped and the system is operated by the subsystem clock, the subsystem clock should be switched again to the main system clock after the oscillation stabilization time is secured by the program.

1. Indicates only oscillation circuit characteristics. Refer to **AC Characteristics** for instruction execution time.
 2. Time required to stabilize oscillation after V_{DD} reaches oscillator voltage MIN.

Cautions

1. When using the subsystem clock oscillator, wiring in the area enclosed with the dotted line should be carried out as follows to avoid an adverse effect from wiring capacitance.

- Wiring should be as short as possible.
- Wiring should not cross other signal lines.
- Wiring should not be placed close to a varying high current.
- The potential of the oscillator capacitor ground should be the same as V_{SS}.
- Do not ground wiring to a ground pattern in which a high current flows.
- Do not fetch a signal from the oscillator.

2. The subsystem clock oscillation circuit is a circuit with a low amplification level, more prone to misoperation due to noise than the main system clock. Particular care is therefore required with the wiring method when the subsystem clock is used.

Caution The oscillation circuit constants and oscillation voltage range indicate conditions for stable oscillation but do not guarantee the accuracy of the oscillation frequency. If the application circuit requires accuracy of the oscillation frequency, it is necessary to set the oscillation frequency of the resonator in the application circuit. For this, it is necessary to directly contact manufacturer of the resonator being used.

Caution Product quality may suffer if the absolute maximum rating is exceeded for even a single parameter or even momentarily. That is, the absolute maximum ratings are rated values at which the product is on the verge of suffering physical damage, and therefore the product must be used under conditions which ensure that the absolute maximum ratings are not exceeded.

Remark The characteristics of a dual-function pin and a port pin are the same unless specified otherwise.

1. When injection current flows through an analog input pin (ANIn : n = 0-7), the A/D conversion result of the analog input becomes the rated value when there is no injection current ±2LSB.
 2. When injection current flows through several analog input pins (ANIn : n = 0-7), the A/D conversion result of the analog input becomes the rated value when there is no injection current ±4LSB.
 3. The average value (absolute value) of the pin injection current is obtained by the following formula.

$$\text{Average value} = \left(\frac{1}{T} \int_0^T |i(t)|^{3/2} dt \right)^{2/3}$$

where, i(t) indicates the pin injection current. The maximum value of |i(t)| is the peak value.

- Notes 1.** Indicates only oscillation circuit characteristics. Refer to **AC Characteristics** for instruction execution time.
2. Time required to stabilize oscillation after reset or STOP mode release.

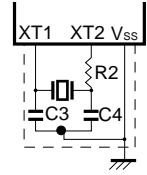

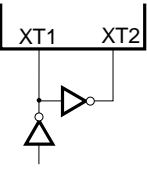

Cautions 1. When using the main system clock oscillator, wiring in the area enclosed with the dotted line should be carried out as follows to avoid an adverse effect from wiring capacitance.

- Wiring should be as short as possible.
- Wiring should not cross other signal lines.
- Wiring should not be placed close to a varying high current.
- The potential of the oscillator capacitor ground should be the same as V_{SS}.
- Do not ground wiring to a ground pattern in which a high current flows.
- Do not fetch a signal from the oscillator.

2. When the main system clock is stopped and the system is operated by the subsystem clock, the subsystem clock should be switched again to the main system clock after the oscillation stabilization time is secured by the program.

- Notes**
1. Indicates only oscillation circuit characteristics. Refer to **AC Characteristics** for instruction execution time.
 2. Time required to stabilize oscillation after V_{DD} reaches oscillator voltage MIN.

Cautions

1. When using the subsystem clock oscillator, wiring in the area enclosed with the dotted line should be carried out as follows to avoid an adverse effect from wiring capacitance.

- Wiring should be as short as possible.
- Wiring should not cross other signal lines.
- Wiring should not be placed close to a varying high current.
- The potential of the oscillator capacitor ground should be the same as V_{ss}.
- Do not ground wiring to a ground pattern in which a high current flows.
- Do not fetch a signal from the oscillator.

2. The subsystem clock oscillation circuit is a circuit with a low amplification level, more prone to misoperation due to noise than the main system clock. Particular care is therefore required with the wiring method when the subsystem clock is used.

Note For P60-P63, if pull-up resistor is not provided (specifiable by mask option) a low-level input leak current of -200 μ A (MAX.) flows only during the 3 clocks (no-wait time) after an instruction has been executed to read out port 6 (P6) or port mode register 6 (PM6). Outside the period of 3 clocks following execution a read-out instruction, the current is -10 μ A (MAX.).

Remark The characteristics of a dual-function pin and a port pin are the same unless specified otherwise.

14. RECOMMENDED SOLDERING CONDITIONS

The μPD78011F(A)/78012F(A)/78013F(A)/78014F(A)/78015F(A)/78016F(A) and 78018F(A) should be soldered and mounted under the conditions recommended in the table below.

For detail of recommended soldering conditions, refer to the information document **Semiconductor Device Mounting Technology Manual (C10535E)**.

For soldering methods and conditions other than those recommended below, contact our salespersonnel.

Soldering Method	Soldering Conditions
Wave soldering (pin only)	Solder bath temperature: 260°C max., Duration: 10 sec. max.
Partial heating	Pin temperature: 300°C max., Duration: 3 sec. max. (per pin)

Caution Wave soldering is only for the lead part in order that jet solder can not contact with the chip directly.

APPENDIX A. DEVELOPMENT TOOLS

The following development tools are available for system development using the μ PD78018F subseries.

Language Processing Software

RA78K/0 Notes 1, 2, 3, 4	78K/0 series common assembler package
CC78K/0 Notes 1, 2, 3, 4	78K/0 series common C compiler package
DF78014 Notes 1, 2, 3, 4	μ PD78014 subseries common device file
CC78K/0-L Notes 1, 2, 3, 4	78K/0 series common C compiler library source file

PROM Writing Tools

PG-1500	PROM programmer
PA-78P014CW PA-78P018GC	Programmer adapter connected to PG-1500
PG-1500 controller Notes 1, 2	PG-1500 control program

Debugging Tool

IE-78000-R	78K/0 series common in-circuit emulator
★ IE-78000-R-A	78K/0 series common in-circuit emulator (integrated debugger)
IE-78000-R-BK	78K/0 series common break board
IE-78014-R-EM-A	μ PD78018F and 78018FY subseries evaluation emulation board ($V_{DD} = 3.0$ to 6.0 V)
EP-78240CW-R EP-78240GC-R	Emulation probe common to μ PD78244 subseries
EV-9200GC-64	Socket to be mounted on target system board created for the 64-pin plastic QFP (GC-AB8 type)
SM78K0 Notes 5, 6, 7	78K/0 series common system simulator
ID78K0 Notes 4, 5, 6, 7	IE-78000-R-A integrated debugger
SD78K/0 Notes 1, 2	IE-78000-R screen debugger
DF78014 Notes 1, 2, 4, 5, 6, 7	Device file common to μ PD78014 subseries

Real-Time OS

RX78K/0 Notes 1, 2, 3, 4	78K/0 series real-time OS
MX78K0 Notes 1, 2, 3, 4	78K/0 series OS

Fuzzy Inference Development Support System

NOTES FOR CMOS DEVICES

① PRECAUTION AGAINST ESD FOR SEMICONDUCTORS

Note: Strong electric field, when exposed to a MOS device, can cause destruction of the gate oxide and ultimately degrade the device operation. Steps must be taken to stop generation of static electricity as much as possible, and quickly dissipate it once, when it has occurred. Environmental control must be adequate. When it is dry, humidifier should be used. It is recommended to avoid using insulators that easily build static electricity. Semiconductor devices must be stored and transported in an anti-static container, static shielding bag or conductive material. All test and measurement tools including work bench and floor should be grounded. The operator should be grounded using wrist strap. Semiconductor devices must not be touched with bare hands. Similar precautions need to be taken for PW boards with semiconductor devices on it.

② HANDLING OF UNUSED INPUT PINS FOR CMOS

Note: No connection for CMOS device inputs can be cause of malfunction. If no connection is provided to the input pins, it is possible that an internal input level may be generated due to noise, etc., hence causing malfunction. CMOS device behave differently than Bipolar or NMOS devices. Input levels of CMOS devices must be fixed high or low by using a pull-up or pull-down circuitry. Each unused pin should be connected to V_{DD} or GND with a resistor, if it is considered to have a possibility of being an output pin. All handling related to the unused pins must be judged device by device and related specifications governing the devices.

③ STATUS BEFORE INITIALIZATION OF MOS DEVICES

Note: Power-on does not necessarily define initial status of MOS device. Production process of MOS does not define the initial operation status of the device. Immediately after the power source is turned ON, the devices with reset function have not yet been initialized. Hence, power-on does not guarantee out-pin levels, I/O settings or contents of registers. Device is not initialized until the reset signal is received. Reset operation must be executed immediately after power-on for devices having reset function.

Regional Information

Some information contained in this document may vary from country to country. Before using any NEC product in your application, please contact the NEC office in your country to obtain a list of authorized representatives and distributors. They will verify:

- Device availability
- Ordering information
- Product release schedule
- Availability of related technical literature
- Development environment specifications (for example, specifications for third-party tools and components, host computers, power plugs, AC supply voltages, and so forth)
- Network requirements

In addition, trademarks, registered trademarks, export restrictions, and other legal issues may also vary from country to country.

The export of this product from Japan is regulated by the Japanese government. To export this product may be prohibited without governmental license, the need for which must be judged by the customer. The export or re-export of this product from a country other than Japan may also be prohibited without a license from that country. Please call an NEC sales representative.

No part of this document may be copied or reproduced in any form or by any means without the prior written consent of NEC Corporation. NEC Corporation assumes no responsibility for any errors which may appear in this document.

NEC Corporation does not assume any liability for infringement of patents, copyrights or other intellectual property rights of third parties by or arising from use of a device described herein or any other liability arising from use of such device. No license, either express, implied or otherwise, is granted under any patents, copyrights or other intellectual property rights of NEC Corporation or others.

While NEC Corporation has been making continuous effort to enhance the reliability of its semiconductor devices, the possibility of defects cannot be eliminated entirely. To minimize risks of damage or injury to persons or property arising from a defect in an NEC semiconductor device, customers must incorporate sufficient safety measures in its design, such as redundancy, fire-containment, and anti-failure features.

NEC devices are classified into the following three quality grades:

"Standard", "Special", and "Specific". The Specific quality grade applies only to devices developed based on a customer designated "quality assurance program" for a specific application. The recommended applications of a device depend on its quality grade, as indicated below. Customers must check the quality grade of each device before using it in a particular application.

Standard: Computers, office equipment, communications equipment, test and measurement equipment, audio and visual equipment, home electronic appliances, machine tools, personal electronic equipment and industrial robots

Special: Transportation equipment (automobiles, trains, ships, etc.), traffic control systems, anti-disaster systems, anti-crime systems, safety equipment and medical equipment (not specifically designed for life support)

Specific: Aircrafts, aerospace equipment, submersible repeaters, nuclear reactor control systems, life support systems or medical equipment for life support, etc.

The quality grade of NEC devices is "Standard" unless otherwise specified in NEC's Data Sheets or Data Books. If customers intend to use NEC devices for applications other than those specified for Standard quality grade, they should contact an NEC sales representative in advance.

Anti-radioactive design is not implemented in this product.
