

16/8-BIT SINGLE-CHIP MICROCONTROLLER

The μ PD784031 is a product of the μ PD784038 sub-series in the 78K/IV series. It contains various peripheral hardware such as RAM, I/O ports, 8-bit resolution A/D and D/A converters, timers, serial interface, and interrupt functions, as well as a high-speed, high-performance CPU.

The μ PD784031 is a ROM-less product of the μ PD784035 and μ PD784036.

For specific functions and other detailed information, consult the following user's manual.

This manual is required reading for design work.

μ PD784038, 784038Y Sub-Series User's Manual, Hardware : U11316E
78K/IV Series User's Manual, Instruction : U10905E

Features

- Pin-compatible with the μ PD78234, μ PD784026, and μ PD784038Y sub-series
- Minimum instruction execution time: 125 ns (at 32 MHz)
- Number of I/O ports: 46
- Serial interface: 3 channels
UART/IOE (3-wire serial I/O): 2 channels
CSI (3-wire serial I/O, 2-wire serial I/O): 1 channel
- PWM outputs: 2
- Timer/counters
16-bit timer/counter \times 3 units
16-bit timer \times 1 unit
- Standby function
HALT/STOP/IDLE mode
- Clock frequency division function
- Watchdog timer: 1 channel
- A/D converter: 8-bit resolution \times 8 channels
- D/A converter: 8-bit resolution \times 2 channels
- Power supply voltage: $V_{DD} = 2.7$ to 5.5 V

Applications

LBP, automatic-focusing camera, PPC, printer, electronic typewriter, air conditioner, electronic musical instruments, cellular telephone, etc.

Ordering Information

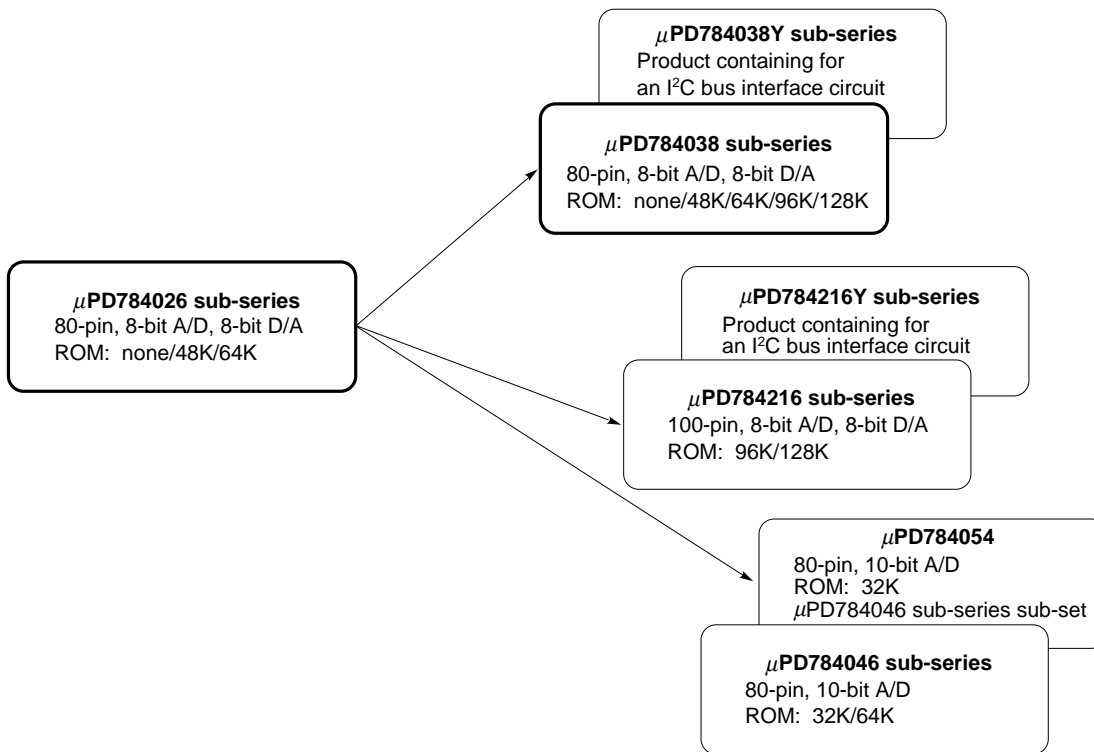

Part number	Package	Internal ROM (bytes)	Internal RAM (bytes)
μ PD784031GC-3B9	80-pin plastic QFP (14 \times 14 \times 2.7 mm)	None	2 048
★ μ PD784031GC-8BT	80-pin plastic QFP (14 \times 14 \times 1.4 mm)	None	2 048
μ PD784031GK-BE9	80-pin plastic TQFP (fine pitch) (12 \times 12 mm)	None	2 048

The information in this document is subject to change without notice.

1. DIFFERENCES BETWEEN μPD784038 SUB-SERIES

The only difference between the μPD784031, μPD784035, μPD784036, μPD784037, and μPD784038 is their capacity of internal memory.

The μPD78P4038 is produced by replacing the masked ROM in the μPD784035, μPD784036, μPD784037, or μPD784038 with 128K-byte one-time PROM or EPROM. Table 1-1 shows the differences between these products.

Table 1-1. Differences between the μPD784038 Sub-Series

Product Item	μPD784031	μPD784035	μPD784036	μPD784037 (under development)	μPD784038 (under development)	μPD78P4038
Internal ROM	None	48K bytes (masked ROM)	64K bytes (masked ROM)	96K bytes (masked ROM)	128K bytes (masked ROM)	128K bytes (one-time PROM or EPROM)
Internal RAM	2 048 bytes			3 584 bytes	4 352 bytes	
Package	80-pin plastic QFP (14 × 14 × 2.7 mm) 80-pin plastic QFP (14 × 14 × 1.4 mm) 80-pin plastic TQFP (fine pitch) (12 × 12 mm)					80-pin ceramic WQFN (14 × 14 mm)

SI0	Input	P27	Serial data input (3-wire serial I/O0)	
SI1		P30/RxD	Serial data input (3-wire serial I/O1)	
SI2		P13/RxD2	Serial data input (3-wire serial I/O2)	
SO0	Output	P33/SDA	Serial data output (3-wire serial I/O0)	
SO1		P31/TxD	Serial data output (3-wire serial I/O1)	
SO2		P14/TxD2	Serial data output (3-wire serial I/O2)	
$\overline{\text{SCK0}}$	I/O	P32/SCL	Serial clock I/O (3-wire serial I/O0)	
$\overline{\text{SCK1}}$		P25/INTP4/ASCK	Serial clock I/O (3-wire serial I/O1)	
$\overline{\text{SCK2}}$		P12/ASCK2	Serial clock I/O (3-wire serial I/O2)	
SCL		P32/ $\overline{\text{SCK0}}$	Serial clock I/O (2-wire serial I/O)	
NMI	Input	P20	External interrupt request	-
INTP0		P21		<ul style="list-style-type: none"> Input of a count clock for timer/counter 1 Capture/trigger signal for CR11 or CR12
INTP1		P22		<ul style="list-style-type: none"> Input of a count clock for timer/counter 2 Capture/trigger signal for CR22
INTP2		P23/CI		<ul style="list-style-type: none"> Input of a count clock for timer/counter 2 Capture/trigger signal for CR21
INTP3		P24		<ul style="list-style-type: none"> Input of a count clock for timer/counter 0 Capture/trigger signal for CR02
INTP4		P25/ASCK/ $\overline{\text{SCK1}}$		-
INTP5		P26		Input of a conversion start trigger for A/D converter
AD0-AD7	I/O	-	Time multiplexing address/data bus (for connecting external memory)	
A8-A15	Output	-	High-order address bus (for connecting external memory)	
A16-A19	Output	P60-P63	High-order address bus during address expansion (for connecting external memory)	
$\overline{\text{RD}}$	Output	-	Strobe signal output for reading the contents of external memory	
$\overline{\text{WR}}$	Output	-	Strobe signal output for writing on external memory	
$\overline{\text{WAIT}}$	Input	P66/HLDRQ	Wait signal insertion	
$\overline{\text{REFRQ}}$	Output	P67/HLDAK	Refresh pulse output to external pseudo static memory	
HLDRQ	Input	P66/ $\overline{\text{WAIT}}$	Input of bus hold request	
HLDAK	Output	P67/ $\overline{\text{REFRQ}}$	Output of bus hold response	
ASTB	Output	-	Latch timing output of time multiplexing address (A0-A7) (for connecting external memory)	

6.2 Non-port pins (2/2)

Pin	I/O	Dual-function	Function
RESET	Input	-	Chip reset
X1	Input	-	Crystal input for system clock oscillation (A clock pulse can also be input to the X1 pin.)
X2	-		
ANI0-ANI7	Input	P70-P77	Analog voltage inputs for the A/D converter
ANO0, ANO1	Output	-	Analog voltage inputs for the D/A converter
AVREF1	-	-	Application of A/D converter reference voltage
AVREF2, AVREF3			Application of D/A converter reference voltage
AVDD			Positive power supply for the A/D converter
AVSS			Ground for the A/D converter
★ VDD0 Note 1			Positive power supply of the port part
★ VDD1 Note 1			Positive power supply except for the port part
★ VSS0 Note 2			Ground of the port part
★ VSS1 Note 2			Ground except for the port part
TEST			Directly connect to VSS0. (The TEST pin is for the IC test.)

Notes 1. The potential of the VDD0 pin must be equal to that of the VDD1 pin.

2. The potential of the VSS0 pin must be equal to that of the VSS1 pin.

6.3 I/O Circuits for Pins and Handling of Unused Pins

Table 6-1 describes the types of I/O circuits for pins and the handling of unused pins.

Figure 6-1 shows the configuration of these various types of I/O circuits.

★

Table 6-1. Types of I/O Circuits for Pins and Handling of Unused Pins (1/2)

Pin	I/O circuit type	I/O	Recommended connection method for unused pins			
P00-P07	5-H	I/O	Input state : To be connected to V _{DD0} Output state: To be left open			
P10/PWM0						
P11/PWM1						
P12/ASCK2/SCK2						
P13/RxD2/SI2						
P14/TxD2/SO2						
P15-P17	5-H					
P20/NMI				2	Input	To be connected to V _{DD0} or V _{SS0}
P21/INTP0						
P22/INTP1				2-C		To be connected to V _{DD0}
P23/INTP2/CI						
P24/INTP3						
P25/INTP4/ASCK/SCK1	8-C	I/O	Input state : To be connected to V _{DD0} Output state: To be left open			
P26/INTP5	2-C	Input	To be connected to V _{DD0}			
P27/SI0						
P30/RxD/SI1	5-H	I/O	Input state : To be connected to V _{DD0} Output state: To be left open			
P31/TxD/SO1						
P32/SCK0/SCL	10-B					
P33/SO0/SDA						
P34/TO0-P37/TO3	5-H					
AD0-AD7						
A8-A15				Output ^{Note}	To be left open	
P60/A16-P63/A19						
RD						
WR						
P66/WAIT/HLDRQ						
P67/REFRQ/HLDAK		I/O	Input state: To be connected to V _{DD0} Output state: To be left open			
P70/ANI0-P77/ANI7				20-A	Input state : To be connected to V _{DD0} or V _{SS0} Output state: To be left open	
ANO0, ANO1		12	Output			To be left open
ASTB	4-B					

Note These pins function as output-only pins depending on the internal circuit, though their I/O type is 5-H.

★

Table 6-1. Types of I/O Circuits for Pins and Handling of Unused Pins (2/2)

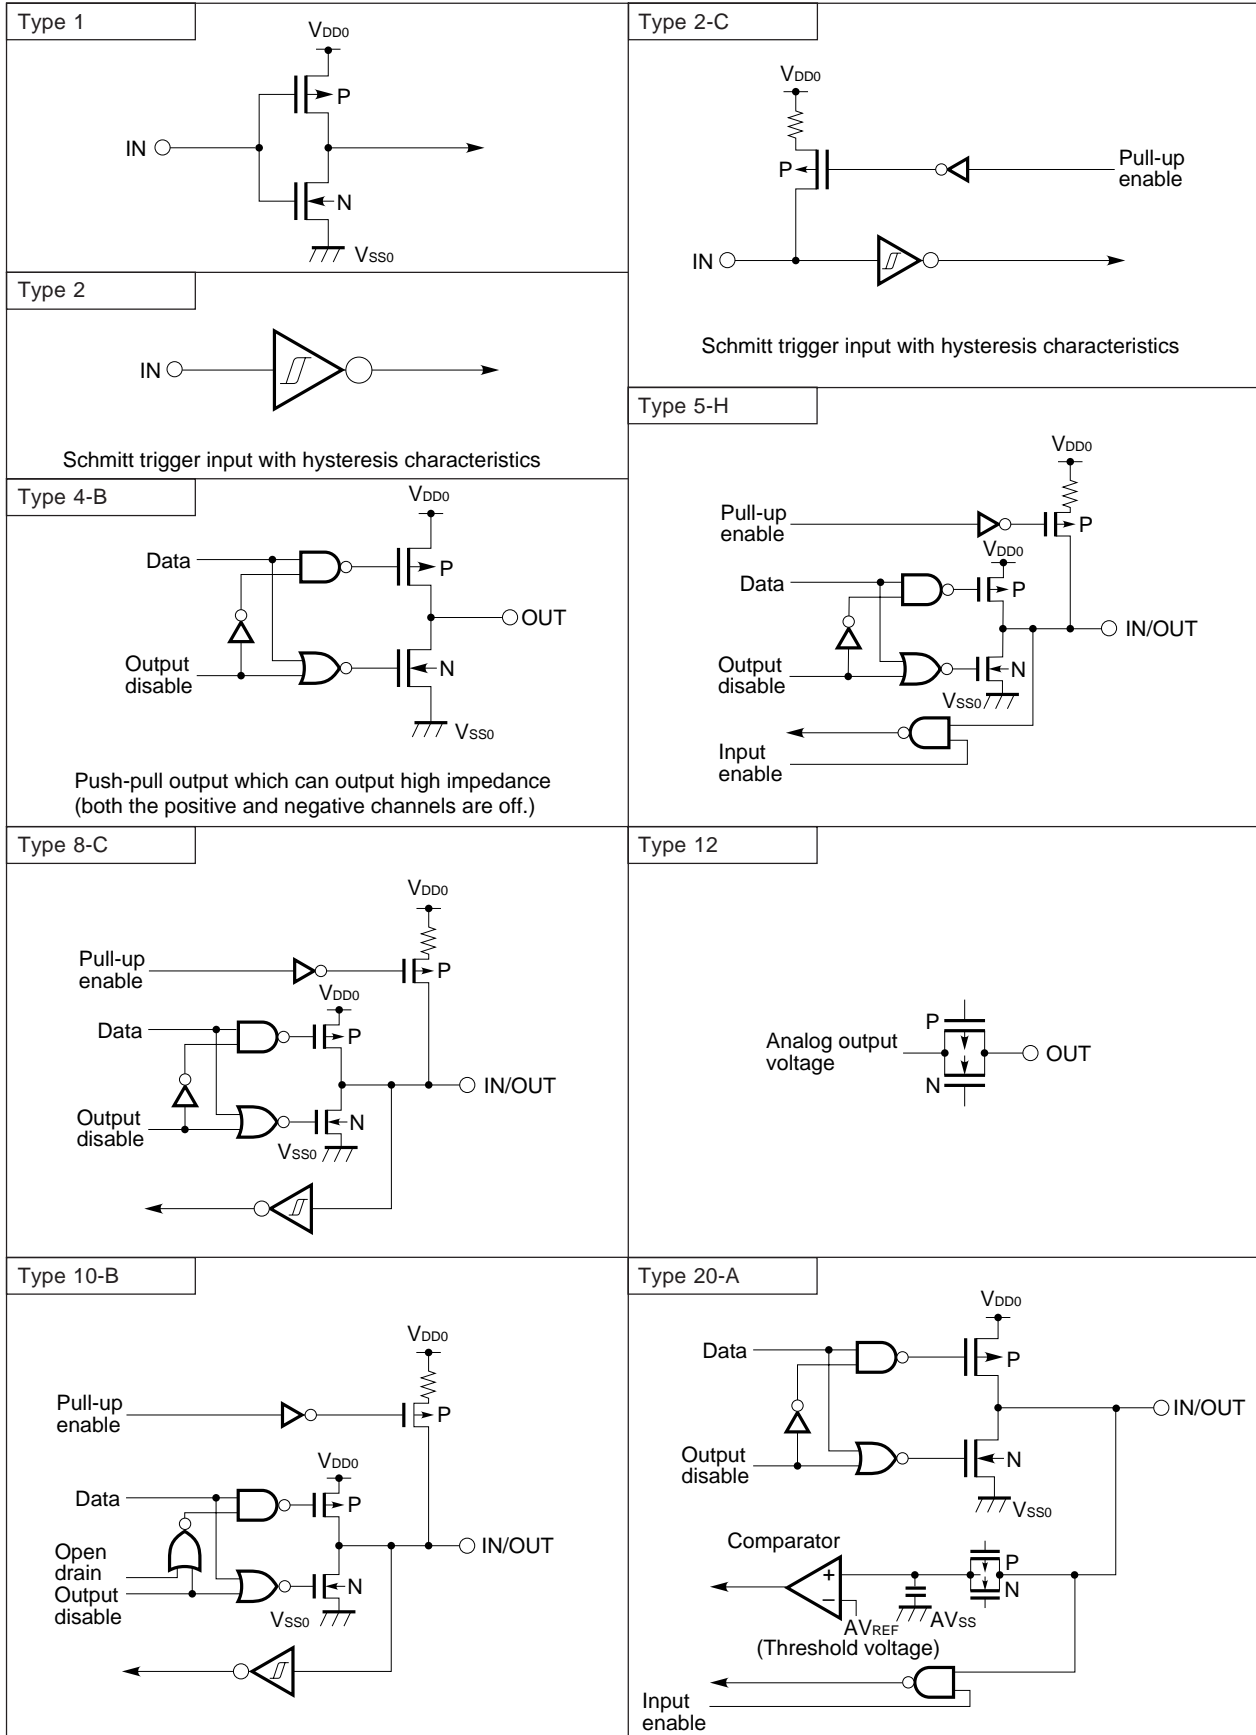

Pin	I/O circuit type	I/O	Recommended connection method for unused pins
RESET	2	Input	-
TEST	1-A		To be connected to V _{SS0} directly
AV _{REF1} -AV _{REF3}	-		To be connected to V _{SS0}
AV _{SS}			
AV _{DD}			To be connected to V _{DD0}

Caution When the I/O mode of an I/O dual-function pin is unpredictable, connect the pin to V_{DD0} through a resistor of 10 to 100 kilohms (particularly when the voltage of the reset input pin becomes higher than that of the low level input at power-on or when I/O is switched by software).

Remark Since type numbers are consistent in the 78K series, those numbers are not always serial in each product. (Some circuits are not included.)

★

Figure 6-1. I/O Circuits for Pins

7. CPU ARCHITECTURE

7.1 Memory Space

A 1M-byte memory space can be accessed. By using a LOCATION instruction, the mode for mapping internal data areas (special function registers and internal RAM) can be selected. A LOCATION instruction must always be executed after a reset, and can be used only once.

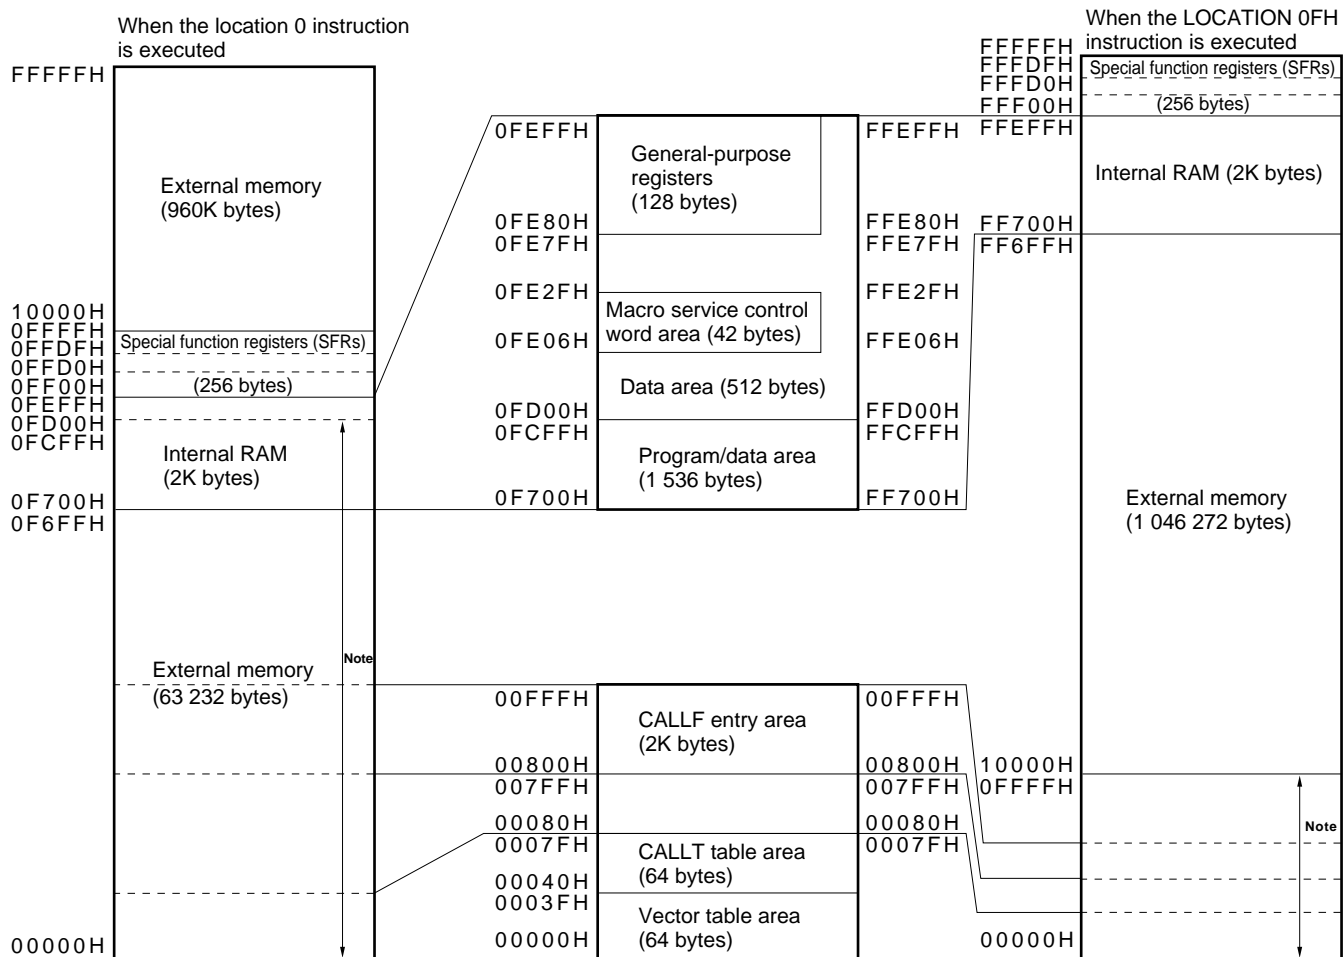

(1) When the LOCATION 0 instruction is executed

Internal data areas are mapped to 0F700H-0FFFFH.

(2) When the LOCATION 0FH instruction is executed

Internal data areas are mapped to FF700H-FFFFFFH.

Figure 7-1. μ PD784031 Memory Map

Note Base area, or entry area based on a reset or interrupt. Internal RAM is excluded in the case of a reset.

7.2 CPU Registers

7.2.1 General-purpose registers

A set of general-purpose registers consists of sixteen general-purpose 8-bit registers. Two 8-bit general-purpose registers can be combined to form a 16-bit general-purpose register. Moreover, four 16-bit general-purpose registers, when combined with an 8-bit register for address extension, can be used as 24-bit address specification registers.

Eight banks of this register set are provided. The user can switch between banks by software or the context switching function.

General-purpose registers other than the V, U, T, and W registers used for address extension are mapped onto internal RAM.

Figure 7-2. General-Purpose Register Format

The character strings enclosed in parentheses represent absolute names.

Caution By setting the RSS bit of PSW to 1, R4, R5, R6, R7, RP2, and RP3 can be used as the X, A, C, B, AX, and BC registers, respectively. However, this function must be used only when using programs for the 78K/III series.

7.2.2 Control registers

(1) Program counter (PC)

This register is a 20-bit program counter. The program counter is automatically updated by program execution.

Figure 7-3. Format of Program Counter (PC)

(2) Program Status Word (PSW)

This register holds the CPU state. The program status word is automatically updated by program execution.

Figure 7-4. Format of Program Status Word (PSW)

Note This flag is used to maintain compatibility with the 78K/III series. This flag must be set to 0 when programs for the 78K/III series are being used.

(3) Stack pointer (SP)

This register is a 24-bit pointer for holding the start address of the stack. The high-order 4 bits must be set to 0.

Figure 7-5. Format of Stack Pointer (SP)

7.2.3 Special function registers (SFRs)

The special function registers are registers with special functions such as mode registers and control registers for built-in peripheral hardware. The special function registers are mapped onto the 256-byte space between 0FF00H and 0FFFFH^{Note}.

Note Applicable when the LOCATION 0 instruction is executed. FFF00H-FFFFFH when the LOCATION 0FH instruction is executed.

Caution Never attempt to access addresses in this area where no SFR is allocated. Otherwise, the μPD784031 may be placed in the deadlock state. The deadlock state can be cleared only by a reset.

Table 7-1 lists the special function registers (SFRs). The titles of the table columns are explained below.

- Abbreviation Symbol used to represent a built-in SFR. The abbreviations listed in the table are reserved words for the NEC assembler (RA78K4). The C compiler (CC78K4) allows the abbreviations to be used as sfr variables with the #pragma sfr command.
- R/W Indicates whether each SFR allows read and/or write operations.
 - R/W : Allows both read and write operations.
 - R : Allows read operations only.
 - W : Allows write operations only.
- Manipulatable bits Indicates the maximum number of bits that can be manipulated whenever an SFR is manipulated. An SFR that supports 16-bit manipulation can be described in the sfrp operand. For address specification, an even-numbered address must be specified.
 - An SFR that supports 1-bit manipulation can be described in a bit manipulation instruction.
- When reset Indicates the state of each register when $\overline{\text{RESET}}$ is applied.

Table 7-1. Special Function Registers (SFRs) (1/4)

Address ^{Note}	Special function register (SFR) name		Abbreviation	R/W	Manipulatable bits			When reset
					1 bit	8 bits	16 bits	
0FF00H	Port 0		P0	R/W	●	●	-	Undefined
0FF01H	Port 1		P1		●	●	-

Note Applicable when the LOCATION 0 instruction is executed. When the LOCATION 0FH instruction is executed, F000H is added to each address.

8. PERIPHERAL HARDWARE FUNCTIONS

8.1 Ports

The ports shown in Figure 8-1 are provided to enable the application of wide-ranging control. Table 8-1 lists the functions of the ports. For the inputs to port 0 to port 6, a built-in pull-up resistor can be specified by software.

Figure 8-1. Port Configuration

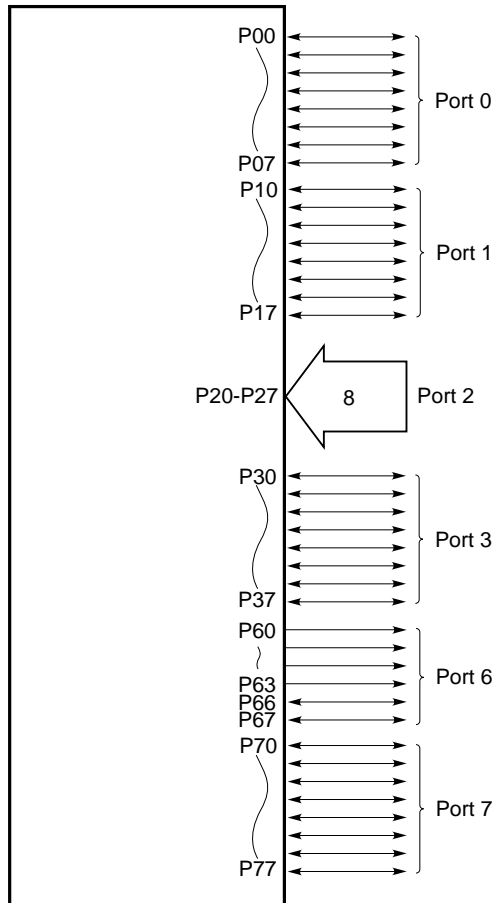

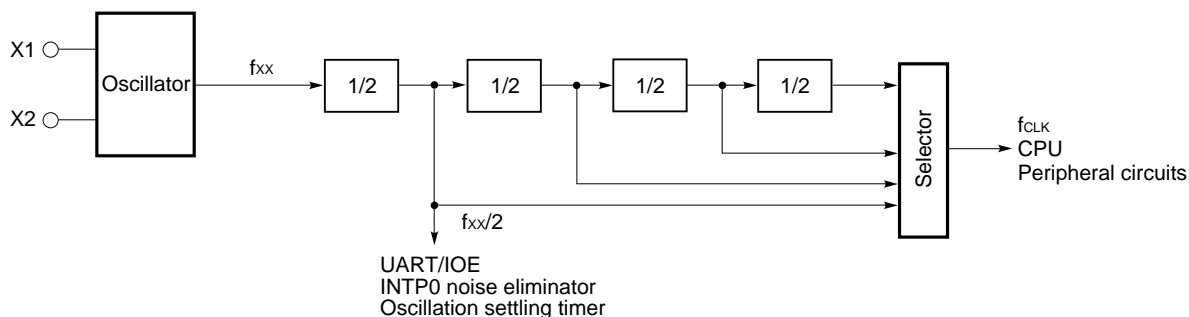

Table 8-1. Port Functions

Port name	Pin	Function	Pull-up specification by software
Port 0	P00-P07	<ul style="list-style-type: none"> • Bit-by-bit input/output setting supported • Operable as 4-bit real-time outputs (P00-P03, P04-P07) • Capable of driving transistors 	Specified as a batch for all pins placed in input mode.
Port 1	P10-P17	<ul style="list-style-type: none"> • Bit-by-bit input/output setting supported • Capable of driving LEDs 	Specified as a batch for all pins placed in input mode.
Port 2	P20-P27	• Input port	Specified for the 6 bits (P22-P27) as a batch.
Port 3	P30-P37	• Bit-by-bit input/output setting supported	Specified as a batch for all pins placed in input mode.
Port 6	P60-P63	• Output-only port	Specified as a batch for all pins placed in input mode.
	P66, P67	• Bit-by-bit input/output setting supported	
Port 7	P70-P77	• Bit-by-bit input/output setting supported	-

8.2 Clock Generator

A circuit for generating the clock signal required for operation is provided. The clock generator includes a frequency divider; low current consumption can be achieved by operating at a lower internal frequency when high-speed operation is not necessary.

Figure 8-2. Block Diagram of Clock Generator

Remark f_{xx} : Oscillator frequency or external clock input
 f_{CLK} : Internal operating frequency

Figure 8-3. Examples of Using Oscillator

(1) Crystal/ceramic oscillation

(2) External clock

- When EXTC bit of OSTS = 1

- When EXTC bit of OSTS = 0

Caution When using the clock generator, to avoid problems caused by influences such as stray capacitance, run all wiring within the area indicated by the dotted lines according to the following rules:

- Minimize the wiring length.
- Wires must never cross other signal lines.
- Wires must never run near a line carrying a large varying current.
- The grounding point of the capacitor of the oscillator circuit must always be at the same potential as V_{SS1}. Never connect the capacitor to a ground pattern carrying a large current.
- Never extract a signal from the oscillator circuit.

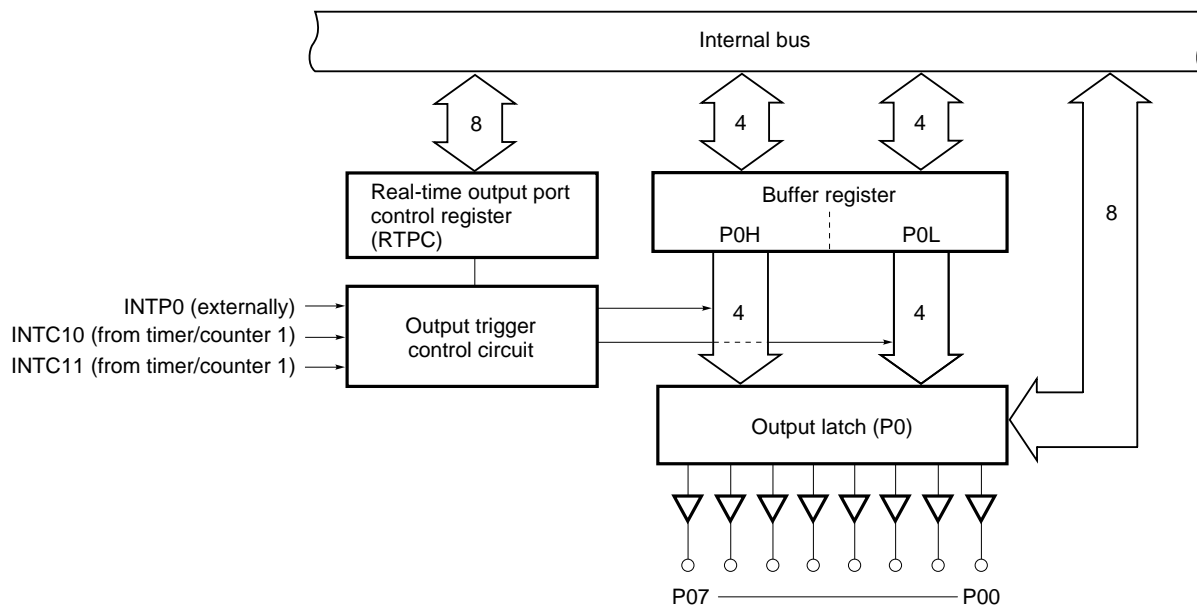

8.3 Real-Time Output Port

The real-time output port outputs data stored in the buffer, synchronized with a timer/counter 1 match interrupt or external interrupt. Thus, pulse output that is free of jitter can be obtained.

Therefore, the real-time output port is best suited to applications (such as open-loop control over stepping motors) where an arbitrary pattern is output at arbitrary intervals.

As shown in Figure 8-4, the real-time output port is built around port 0 and the port 0 buffer register (P0H, P0L).

Figure 8-4. Block Diagram of Real-Time Output Port

8.4 Timers/Counters

Three timer/counter units and one timer unit are incorporated.

Moreover, seven interrupt requests are supported, allowing these units to function as seven timer/counter units.

Table 8-2. Timer/Counter Operation

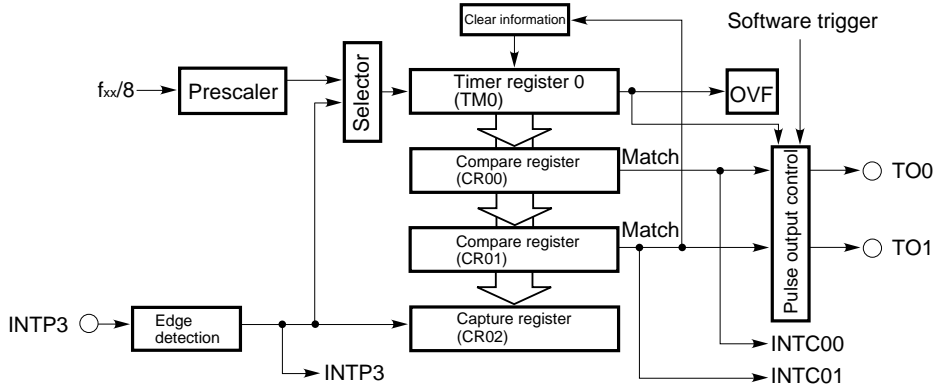

Item \ Name		Timer/counter 0	Timer/counter 1	Timer/counter 2	Timer 3
Count pulse width	8 bits	-	●	●	●
	16 bits	●	●	●	●
Operating mode	Interval timer	2ch	2ch	2ch	1ch
	External event counter	●	●	●	-
	One-shot timer	-	-	●	-
Function	Timer output	2ch	-	2ch	-
	Toggle output	●	-	●	-
	PWM/PPG output	●	-	●	-
	One-shot pulse output ^{Note}	●	-	-	-
	Real-time output	-	●	-	-
	Pulse width measurement	1 input	1 input	2 inputs	-
	Number of interrupt requests	2	2	2	1

Note The one-shot pulse output function makes the level of a pulse output active by software, and makes the level of a pulse output inactive by hardware (interrupt request signal).

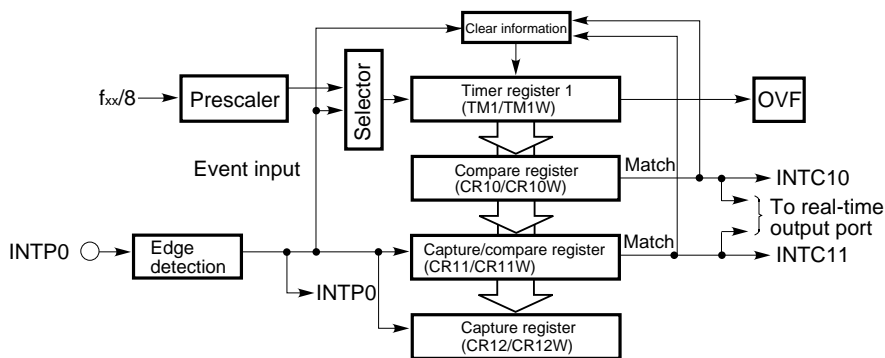

Note that this function differs from the one-shot timer function of timer/counter 2.

Figure 8-5. Timer/Counter Block Diagram

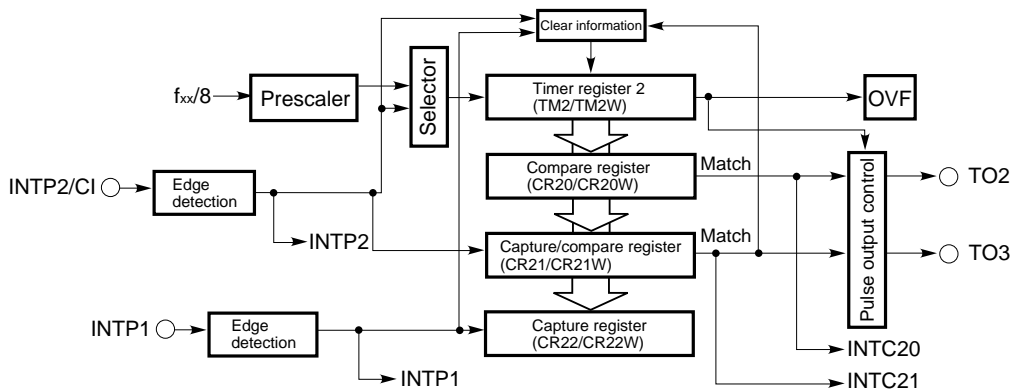

Timer/counter 0

Timer/counter 1

Timer/counter 2

Timer 3

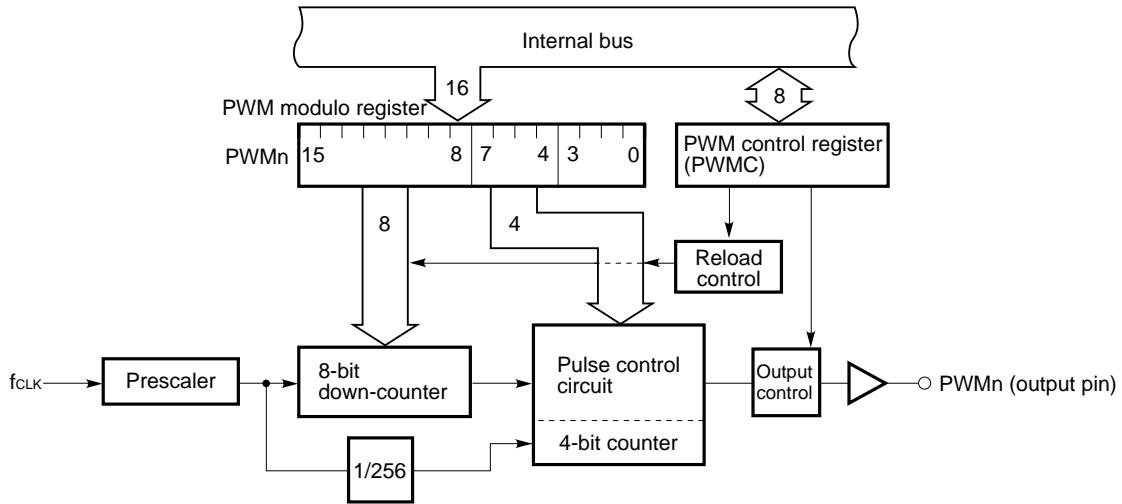

Remark OVF: Overflow flag

8.5 PWM Output (PWM0, PWM1)

Two channels of PWM (pulse width modulation) output circuitry with a resolution of 12 bits and a repetition frequency of 62.5 kHz ($f_{CLK} = 16 \text{ MHz}$) are incorporated. Low or high active level can be selected for the PWM output channels, independently of each other. This output is best suited to DC motor speed control.

Figure 8-6. Block Diagram of PWM Output Unit

Remark n = 0, 1

8.6 A/D Converter

An analog/digital (A/D) converter having 8 multiplexed analog inputs (ANI0-ANI7) is incorporated.

The successive approximation system is used for conversion. The result of conversion is held in the 8-bit A/D conversion result register (ADCR). Thus, speedy high-precision conversion can be achieved. (The conversion time is about 7.5 μs at f_{CLK} = 16 MHz.)

A/D conversion can be started in any of the following modes:

- Hardware start: Conversion is started by means of trigger input (INTP5).
- Software start : Conversion is started by means of bit setting the A/D converter mode register (ADM).

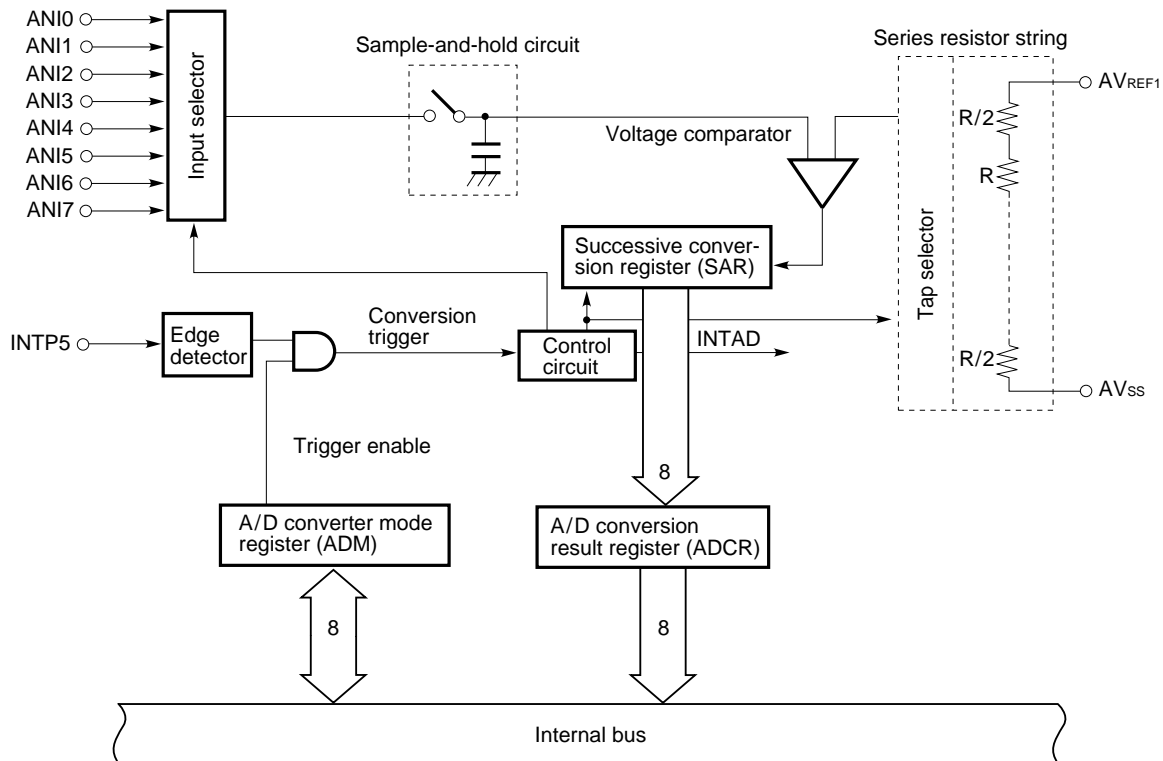

After conversion has started, one of the following modes can be selected:

- Scan mode : Multiple analog inputs are selected sequentially to obtain conversion data from all pins.
- Select mode: A single analog input is selected at all times to enable conversion data to be obtained continuously.

ADM is used to specify the above modes, as well as the termination of conversion.

When the result of conversion is transferred to ADCR, an interrupt request (INTAD) is generated. Using this feature, the results of conversion can be continuously transferred to memory by the macro service.

Figure 8-7. Block Diagram of A/D Converter

8.7 D/A Converter

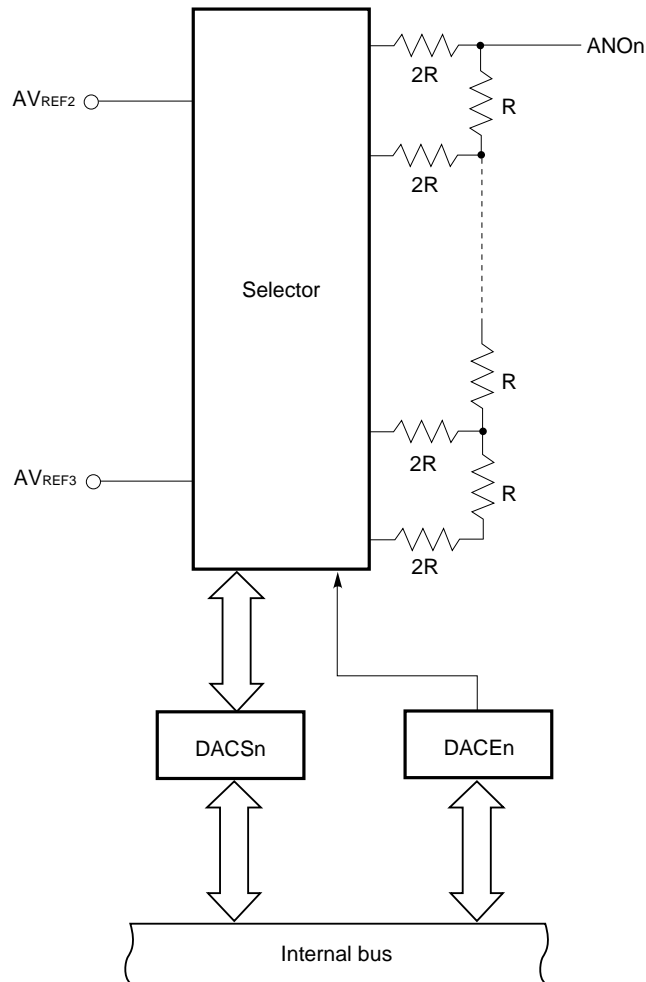

Two digital/analog (D/A) converter channels of voltage output type, having a resolution of 8 bits, are incorporated.

An R-2R resistor ladder system is used for conversion. By writing the value to be subject to D/A conversion in the 8-bit D/A conversion value setting register (DACSn: n = 0, 1), the resulting analog value is output on ANOn (n = 0, 1). The range of the output voltages is determined by the voltages applied to the AVREF2 and AVREF3 pins.

Because of its high output impedance, no current can be obtained from an output pin. When the load impedance is low, insert a buffer amplifier between the load and the converter.

The impedance of the ANOn pin goes high while the RESET signal is low. DACSn is set to 0 after a reset is released.

Figure 8-8. Block Diagram of D/A Converter

Remark n = 0, 1

8.8 Serial Interface

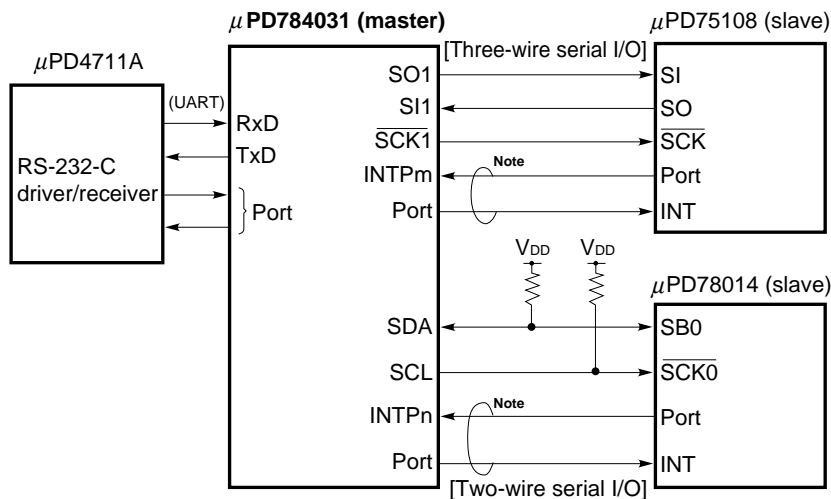

Three independent serial interface channels are incorporated.

- Asynchronous serial interface (UART)/three-wire serial I/O (IOE) × 2
- Synchronous serial interface (CSI) × 1
 - Three-wire serial I/O (IOE)
 - Two-wire serial I/O (IOE)

So, communication with points external to the system and local communication within the system can be performed at the same time. (See **Figure 8-9.**)

Figure 8-9. Example Serial Interfaces

UART + Three-wire serial I/O + Two-wire serial I/O

Note Handshake line

8.8.1 Asynchronous serial interface/three-wire serial I/O (UART/IOE)

Two serial interface channels are available; for each channel, asynchronous serial interface mode or three-wire serial I/O mode can be selected.

(1) Asynchronous serial interface mode

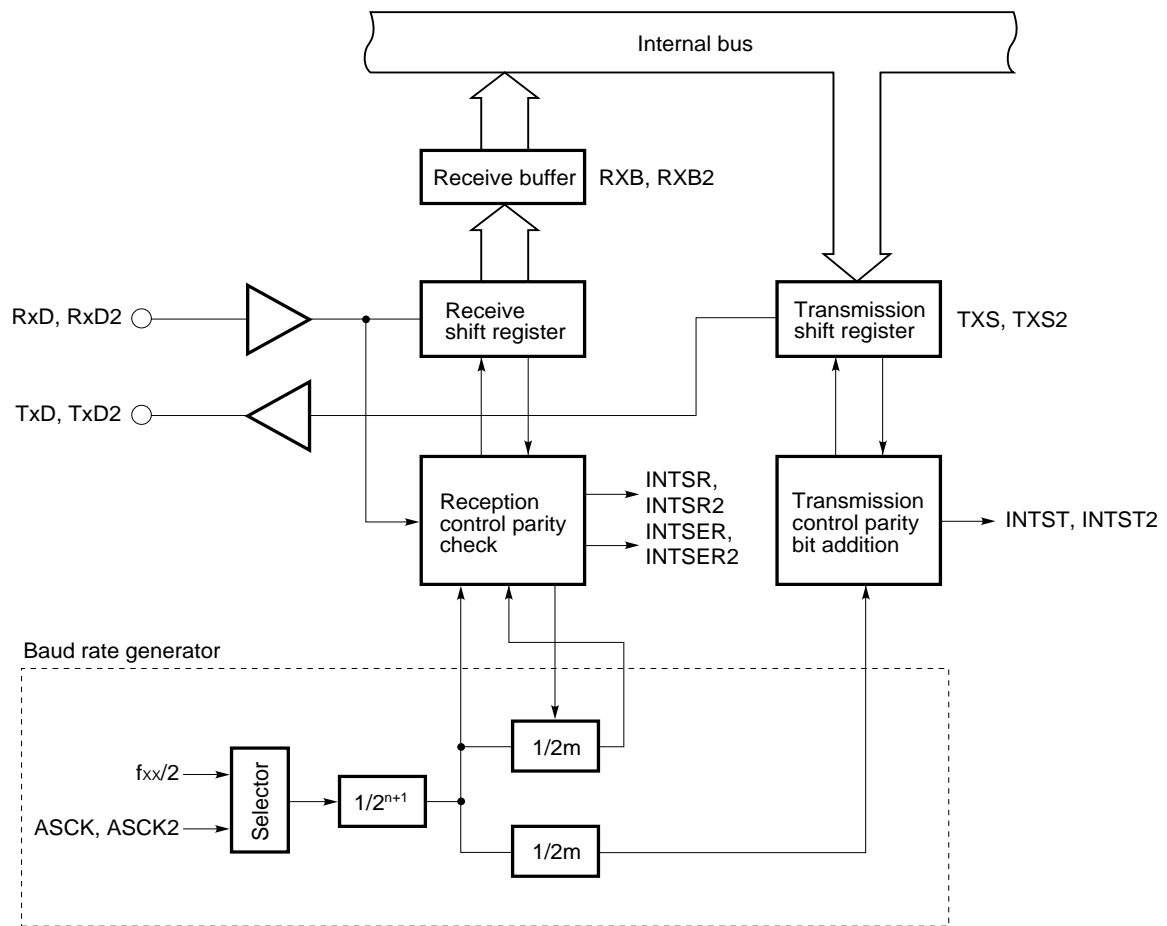

In this mode, 1-byte data is transferred after a start bit.

A baud rate generator is incorporated to enable communication at a wide range of baud rates.

Moreover, the frequency of a clock signal applied to the ASCK pin can be divided to define a baud rate.

With the baud rate generator, the baud rate conforming to the MIDI standard (31.25 kbps) can be obtained.

Figure 8-10. Block Diagram of Asynchronous Serial Interface Mode

Remark f_{xx} : Oscillator frequency or external clock input
 $n = 0$ to 11
 $m = 16$ to 30

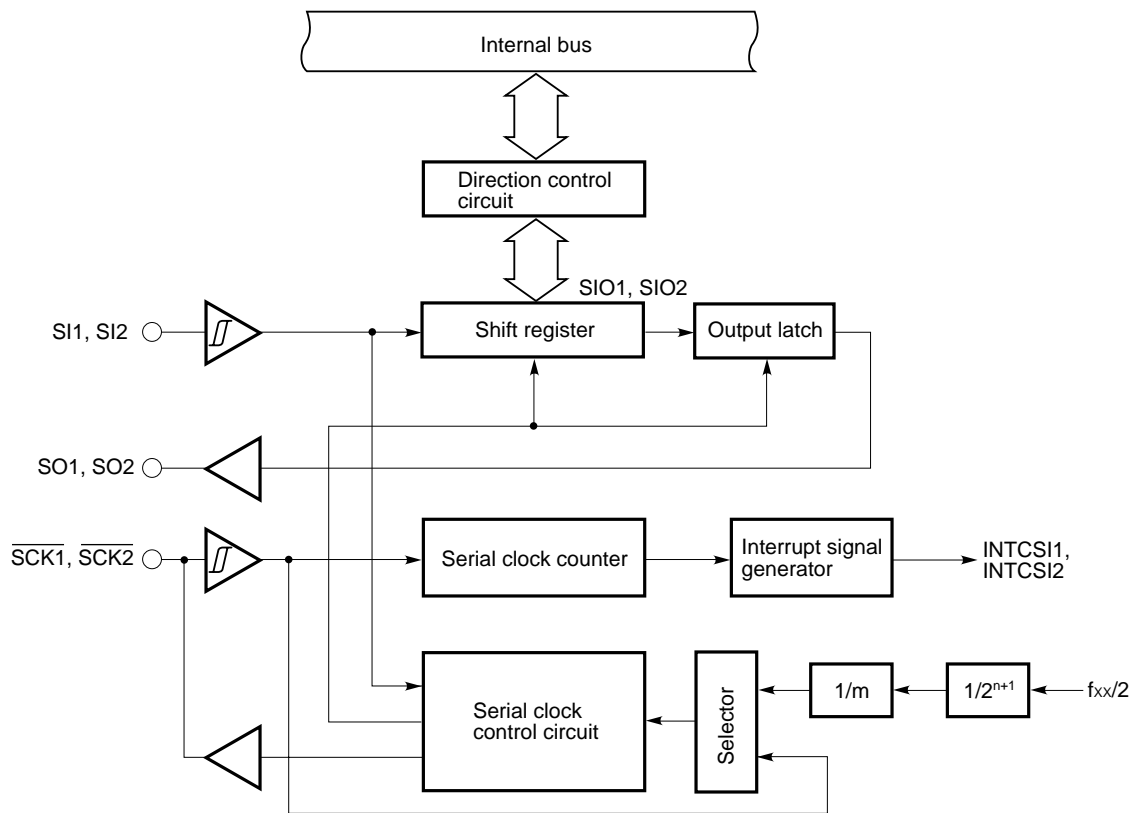

(2) Three-wire serial I/O mode

In this mode, the master device makes the serial clock active to start transmission, then transfers 1-byte data in phase with the clock.

This mode is designed for communication with a device incorporating a conventional synchronous serial interface. Basically, three lines are used for communication: the serial clock line (\overline{SCK}) and the two serial data lines (SI and SO).

In general, a handshake line is required to check the state of communication.

Figure 8-11. Block Diagram of Three-Wire Serial I/O Mode

Remark f_{xx} : Oscillator frequency or external clock input

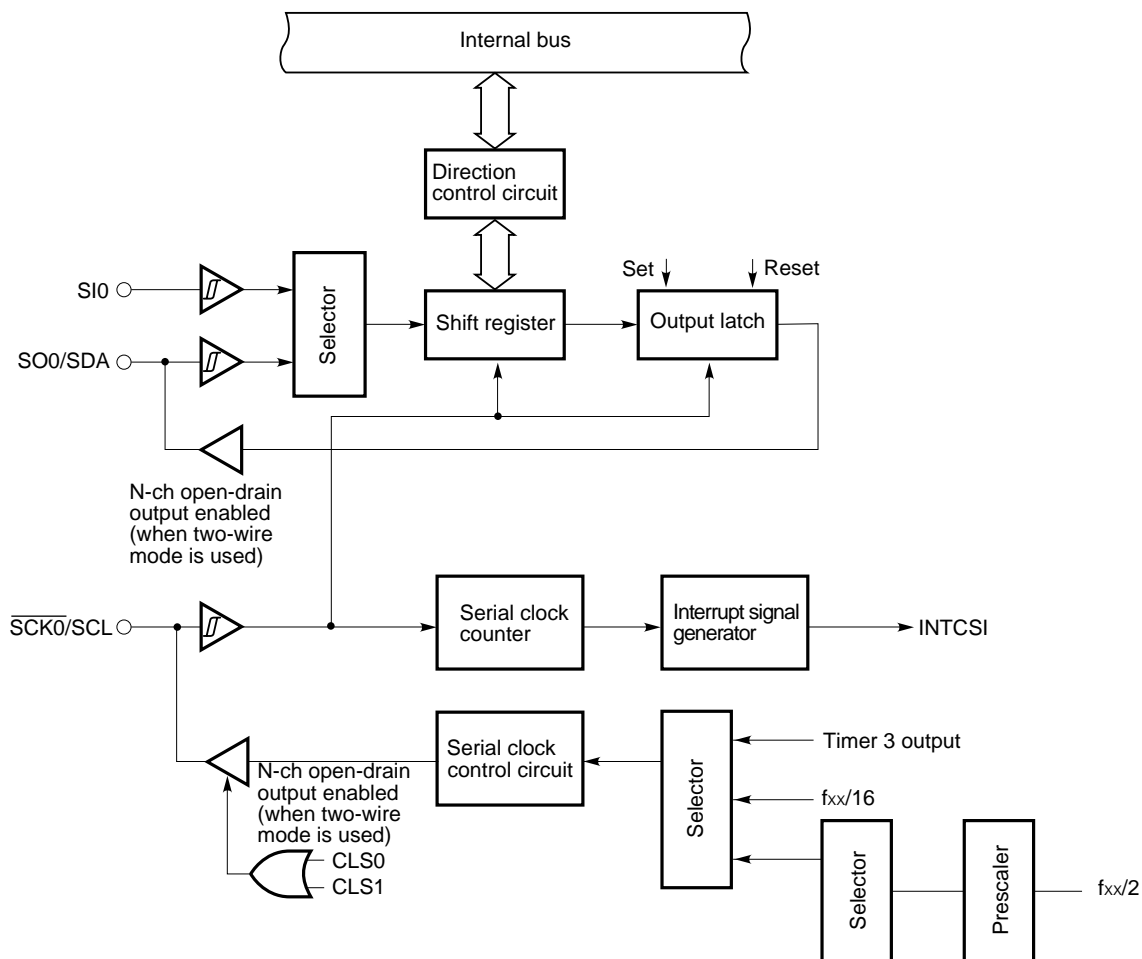

$n = 0$ to 11

$m = 1, 16$ to 30

8.8.2 Synchronous serial interface (CSI)

With this interface, the master device makes the serial clock active to start transmission, then transfers 1-byte data in phase with the clock.

Figure 8-12. Block Diagram of Synchronous Serial Interface

Remark f_{xx} : Oscillator frequency or external clock input

(1) Three-wire serial I/O mode

This mode is designed for communication with a device incorporating a conventional synchronous serial interface. Basically, three lines are used for communication: the serial clock line ($\overline{SCK0}$) and serial data lines (SI0 and SO0). In general, a handshake line is required to check the state of communication.

(2) Two-wire serial I/O mode

In this mode, 8-bit data is transferred using two lines: the serial clock line (SCL) and serial data bus (SDA). In general, a handshake line is required to check the communication state.

8.9 Edge Detection Function

The interrupt input pins (NMI, INTP0-INTP5) are used to apply not only interrupt requests but also trigger signals for the built-in circuits. As these pins are triggered by an edge (rising or falling) of an input signal, a function for edge detection is incorporated. Moreover, a noise suppression function is provided to prevent erroneous edge detection caused by noise.

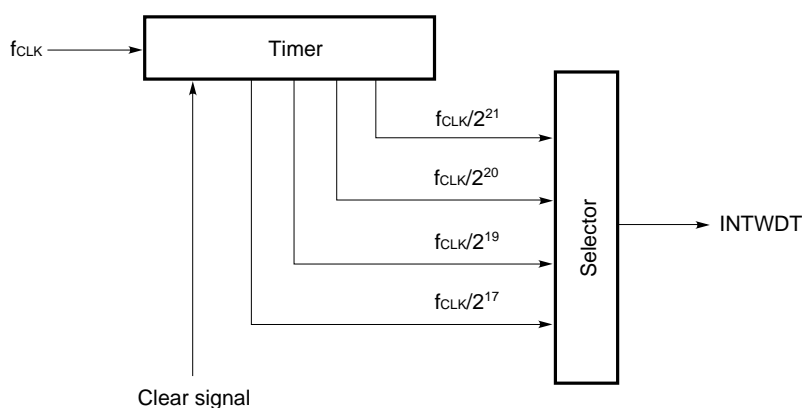

Pin	Detectable edge	Noise suppression method
NMI	Rising edge or falling edge	Analog delay
INTP0-INTP3	Rising edge or falling edge, or both edges	Clock sampling ^{Note}
INTP4, INTP5		Analog delay

Note INTP0 is used for sampling clock selection.

8.10 Watchdog Timer

A watchdog timer is incorporated for CPU runaway detection. The watchdog timer, if not cleared by software within a specified interval, generates a nonmaskable interrupt. Furthermore, once watchdog timer operation is enabled, it cannot be disabled by software. The user can specify whether priority is placed on an interrupt based on the watchdog timer or on an interrupt based on the NMI pin.

Figure 8-13. Block Diagram of Watchdog Timer

9. INTERRUPT FUNCTION

Table 9-1 lists the interrupt request handling modes. These modes are selected by software.

Table 9-1. Interrupt Request Handling Modes

Handling mode	Handled by	Handling	PC and PSW contents
Vectored interrupt	Software	Branches to a handling routine for execution (arbitrary handling).	The PC and PSW contents are pushed to and popped from the stack.
Context switching		Automatically selects a register bank, and branches to a handling routine for execution (arbitrary handling).	The PC and PSW contents are saved to and read from a fixed area in the register bank.
Macro service	Firmware	Performs operations such as memory-to-I/O-device data transfer (fixed handling).	Maintained

9.1 Interrupt Source

★ An interrupt can be issued from any one of the interrupt sources listed in Table 9-2: execution of BRK and BRKCS instructions, an operand error, or any of the 23 other interrupt sources.

Four levels of interrupt handling priority can be set. Priority levels can be set to nest control during interrupt handling or to concurrently generate interrupt requests. Nested macro services, however, are performed without suspension.

When interrupt requests having the same priority level are generated, they are handled according to the default priority (fixed). (See **Table 9-2**.)

★ **Table 9-2. Interrupt Sources**

Type	Default priority	Source		Internal/external	Macro service		
		Name	Trigger				
Software	-	BRK instruction	Instruction execution	-	-		
		BRKCS instruction					
		Operand error	When the MOV STBC,#byte, MOV WDM,#byte, or LOCATION instruction is executed, exclusive OR of the byte operand and byte does not produce FFH.				
Nonmaskable	-	NMI	Detection of edge input on the pin	External	-		
		WDT	Watchdog timer overflow	Internal			
Maskable	0 (highest)	INTP0	Detection of edge input on the pin (TM1/TM1W capture trigger, TM1/TM1W event counter input)	External	Enabled		
	1	INTP1	Detection of edge input on the pin (TM2/TM2W capture trigger, TM2/TM2W event counter input)				
	2	INTP2	Detection of edge input on the pin (TM2/TM2W capture trigger, TM2/TM2W event counter input)				
	3	INTP3	Detection of edge input on the pin (TM0 capture trigger, TM0 event counter input)				
	4	INTC00	TM0-CR00 match signal issued	Internal	Enabled		
	5	INTC01	TM0-CR01 match signal issued				
	6	INTC10	TM1-CR10 match signal issued (in 8-bit operation mode) TM1W-CR10W match signal issued (in 16-bit operation mode)				
	7	INTC11	TM1-CR11 match signal issued (in 8-bit operation mode) TM1W-CR11W match signal issued (in 16-bit operation mode)				
	8	INTC20	TM2-CR20 match signal issued (in 8-bit operation mode) TM2W-CR20W match signal issued (in 16-bit operation mode)				
	9	INTC21	TM2-CR21 match signal issued (in 8-bit operation mode) TM2W-CR21W match signal issued (in 16-bit operation mode)				
	10	INTC30	TM3-CR30 match signal issued (in 8-bit operation mode) TM3W-CR30W match signal issued (in 16-bit operation mode)				
	11	INTP4	Detection of edge input on the pin			External	Enabled
	12	INTP5	Detection of edge input on the pin				
	13	INTAD	A/D converter processing completed (ADCR transfer)			Internal	Enabled
	14	INTSER	ASI0 reception error	-			
	15	INTSR	ASI0 reception completed or CSI1 transfer completed	Enabled			
		INTCSI1					
	16	INTST	ASI0 transmission completed	Enabled			
	17	INTCSI	CSI0 transfer completed				
	18	INTSER2	ASI2 reception error	-			
19	INTSR2	ASI2 reception completed or CSI2 transfer completed	Enabled				
	INTCSI2						
20 (lowest)	INTST2	ASI2 transmission completed					

Remark ASI: Asynchronous serial interface
 CSI: Synchronous serial interface

9.2 Vectored Interrupt

When a branch to an interrupt handling routine occurs, the vector table address corresponding to the interrupt source is used as the branch address.

Interrupt handling by the CPU consists of the following operations:

- When a branch occurs : Push the CPU status (PC and PSW contents) to the stack.
- When control is returned: Pop the CPU status (PC and PSW contents) from the stack.

To return control from the handling routine to the main routine, use the RETI instruction. The branch destination addresses must be within the range of 0 to FFFFH.

Table 9-3. Vector Table Address

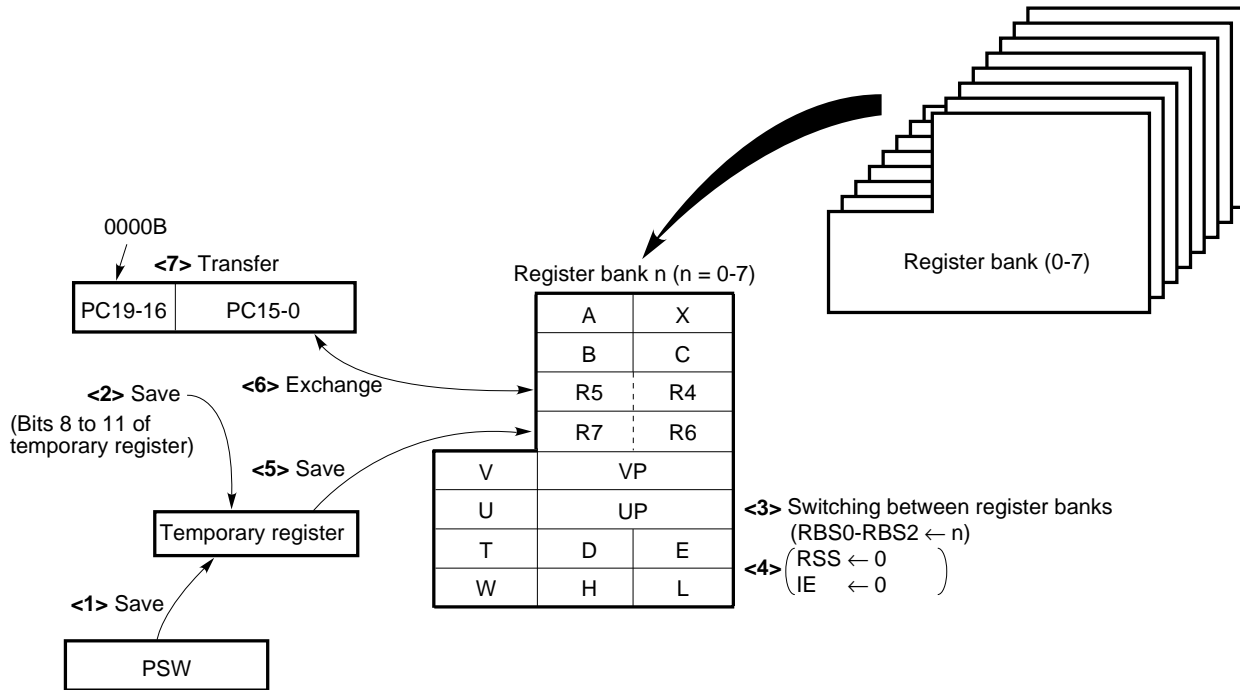

Interrupt source	Vector table address
BRK instruction	003EH
Operand error	003CH
NMI	0002H
WDT	0004H
INTP0	0006H
INTP1	0008H
INTP2	000AH
INTP3	000CH

9.3 Context Switching

When an interrupt request is generated, or when the BRKCS instruction is executed, an appropriate register bank is selected by the hardware. Then, a branch to a vector address stored in that register bank occurs. At the same time, the contents of the current program counter (PC) and program status word (PSW) are stacked in the register bank.

The branch address must be within the range of 0 to FFFFH.

Figure 9-1. Context Switching Caused by an Interrupt Request

9.4 Macro Service

The macro service function enables data transfer between memory and special function registers (SFRs) without requiring the intervention of the CPU. The macro service controller accesses both memory and SFRs within the same transfer cycle to directly transfer data without having to perform data fetch.

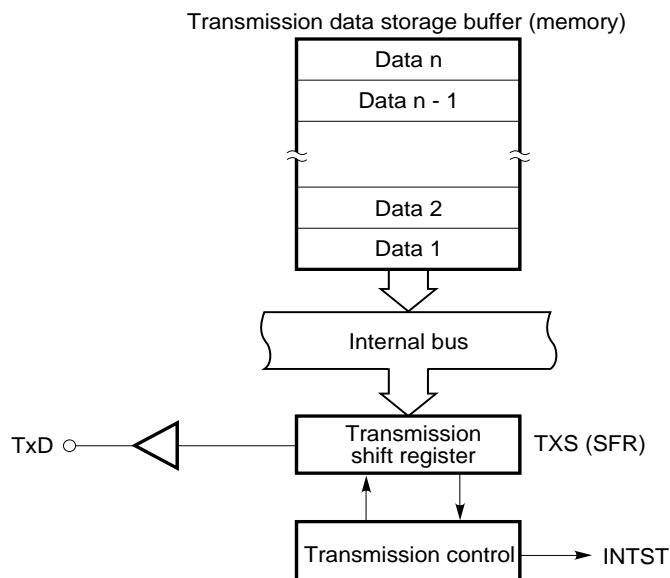

Since the CPU status is neither saved nor restored, nor is data fetch performed, high-speed data transfer is possible.

Figure 9-2. Macro Service

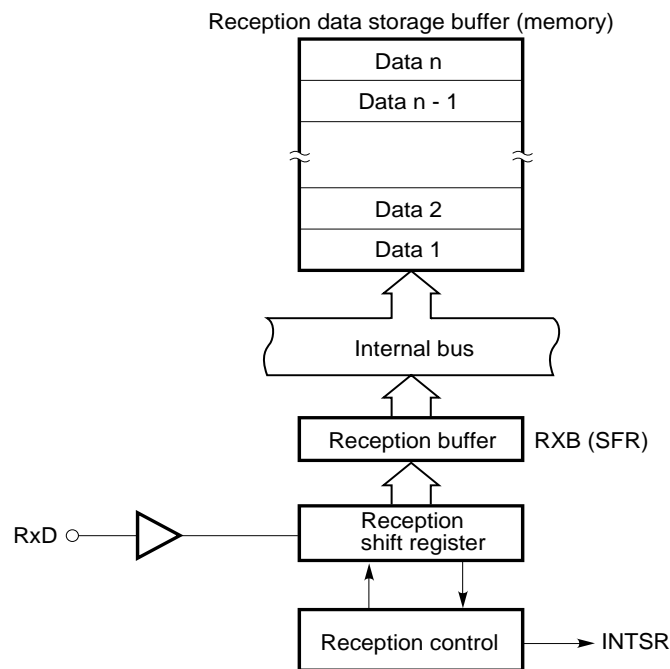

9.5 Examples of Macro Service Applications

(1) Serial interface transmission

Each time a macro service request (INTST) is generated, the next transmission data is transferred from memory to TXS. When data n (last byte) has been transferred to TXS (that is, once the transmission data storage buffer becomes empty), a vectored interrupt request (INTST) is generated.

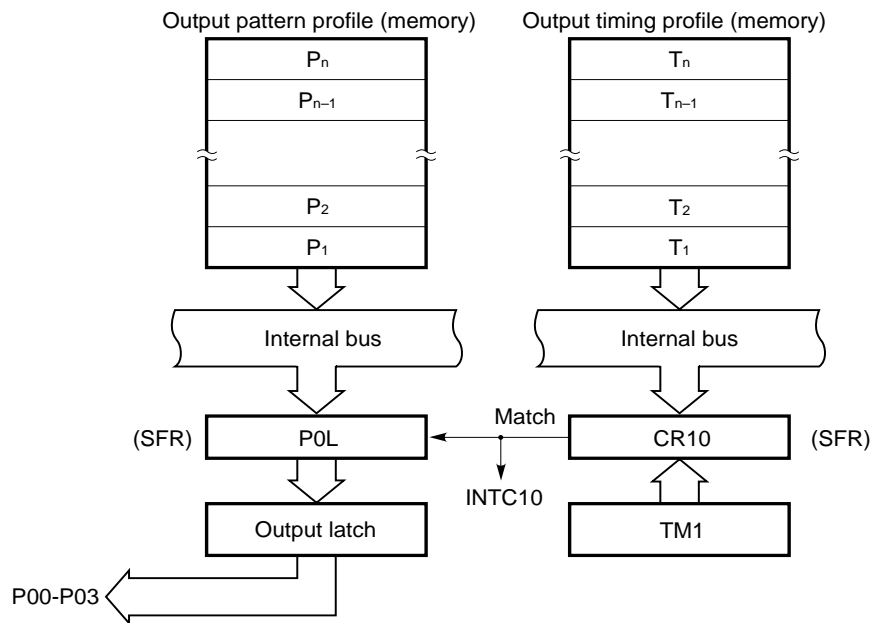

(2) Serial interface reception

Each time a macro service request (INTSR) is generated, reception data is transferred from RXB to memory. When data n (last byte) has been transferred to memory (that is, once the reception data storage buffer becomes full), a vectored interrupt request (INTSR) is generated.

(3) Real-time output port

INTC10 and INTC11 function as the output triggers for the real-time output ports. For these triggers, the macro service can simultaneously set the next output pattern and interval. Therefore, INTC10 and INTC11 can be used to independently control two stepping motors. They can also be applied to PWM and DC motor control.

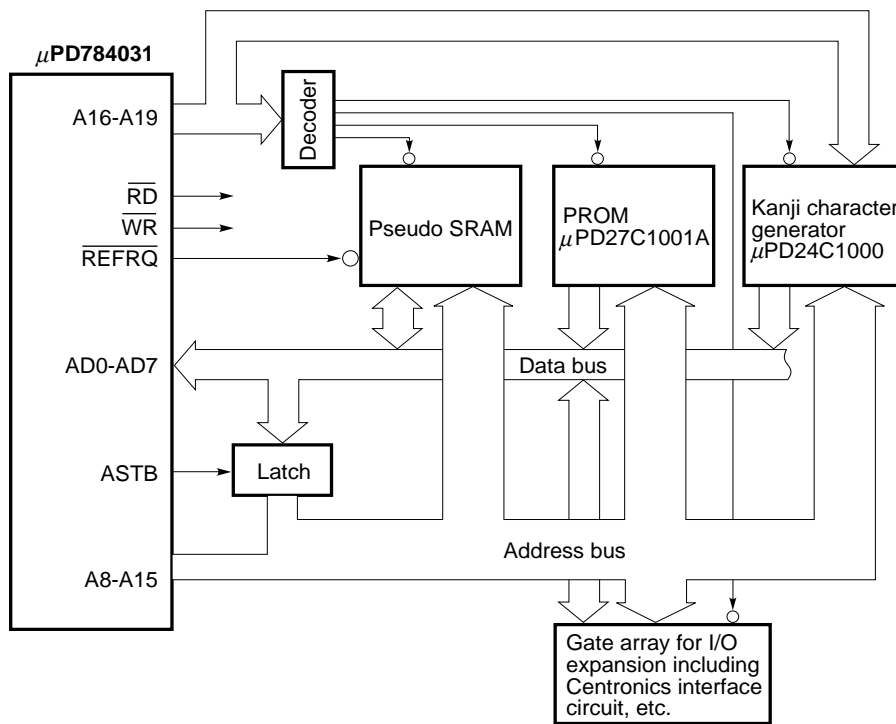

Each time a macro service request (INTC10) is generated, a pattern and timing data are transferred to the buffer register (P0L) and compare register (CR10), respectively. When the contents of timer register 1 (TM1) and CR10 match, another INTC10 is generated, and the P0L contents are transferred to the output latch. When T_n (last byte) is transferred to CR10, a vectored interrupt request (INTC10) is generated. For INTC11, the same operation as that performed for INTC10 is performed.

10. LOCAL BUS INTERFACE

The local bus interface enables the connection of external memory and I/O devices (memory-mapped I/O). It supports a 1M-byte memory space. (See Figure 10-1.)

Figure 10-1. Example of Local Bus Interface

10.1 Memory Expansion

By adding external memory, program memory or data memory can be expanded, 256 bytes at a time, to approximately 1M byte (seven steps).

10.2 Memory Space

The 1M-byte memory space is divided into eight spaces, each having a logical address. Each of these spaces can be controlled using the programmable wait and pseudo-static RAM refresh functions.

Figure 10-2. Memory Space

10.3 Programmable Wait

When the memory space is divided into eight spaces, a wait state can be separately inserted for each memory space while the \overline{RD} or \overline{WR} signal is active. This prevents the overall system efficiency from being degraded even when memory devices having different access times are connected.

In addition, an address wait function that extends the ASTB signal active period is provided to produce a longer address decode time. (This function is set for the entire space.)

10.4 Pseudo-Static RAM Refresh Function

Refresh is performed as follows:

- Pulse refresh : A bus cycle is inserted where a refresh pulse is output on the \overline{REFRQ} pin at regular intervals. When the memory space is divided into eight, and a specified area is being accessed, refresh pulses can also be output on the \overline{REFRQ} pin as the memory is being accessed. This can prevent the refresh cycle from suspending normal memory access.
- Power-down self-refresh : In standby mode, a low-level signal is output on the \overline{REFRQ} pin to maintain the contents of pseudo-static RAM.

10.5 Bus Hold Function

A bus hold function is provided to facilitate connection to devices such as a DMA controller. Suppose that a bus hold request signal (HLDRQ) is received from an external bus master. In this case, upon the completion of the bus cycle being performed, the address bus, address/data bus, ASTB, \overline{RD} , and \overline{WR} pins are placed in the high-impedance state, and the bus hold acknowledge signal (HLDAK) is made active to release the bus for the external bus master.

While the bus hold function is being used, the external wait and pseudo-static RAM refresh functions are disabled.

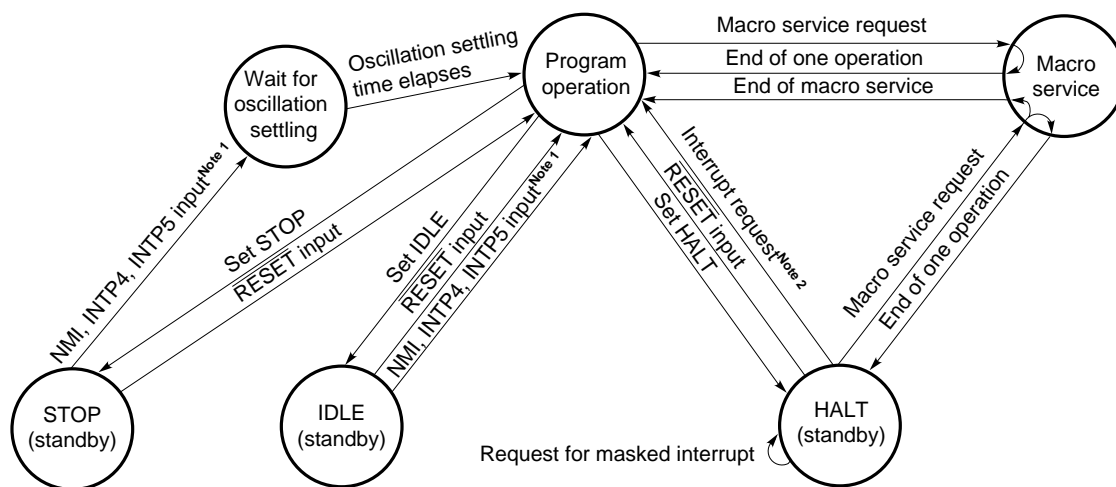

11. STANDBY FUNCTION

The standby function allows the power consumption of the chip to be reduced. The following standby modes are supported:

- HALT mode : The CPU operation clock is stopped. By occasionally inserting the HALT mode during normal operation, the overall average power consumption can be reduced.
- IDLE mode : The entire system is stopped, with the exception of the oscillator circuit. This mode consumes only very little more power than STOP mode, but normal program operation can be restored in almost as little time as that required to restore normal program operation from HALT mode.
- STOP mode : The oscillator is stopped. All operations in the chip stop, such that only leakage current flows.

These modes can be selected by software.
A macro service can be initiated in HALT mode.

Figure 11-1. Standby Mode Status Transition

- Notes**
1. INTP4 and INTP5 are applied when not masked.
 2. Only when the interrupt request is not masked

Remark NMI is enabled only by external input. The watchdog timer cannot be used to release one of the standby modes (STOP or IDLE mode).

12. RESET FUNCTION

Applying a low-level signal to the $\overline{\text{RESET}}$ pin initializes the internal hardware (reset status).

When the $\overline{\text{RESET}}$ input makes a low-to-high transition, the following data is loaded into the program counter (PC):

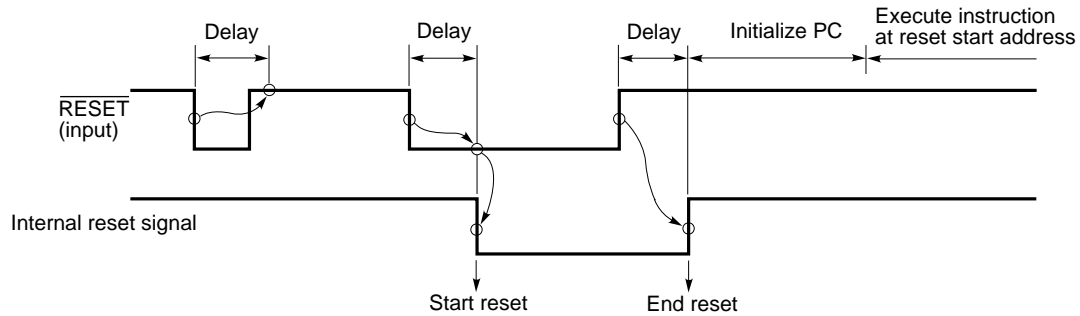

- Eight low-order bits of the PC : Contents of location at address 0000H
- Intermediate eight bits of the PC : Contents of location at address 0001H
- Four high-order bits of the PC : 0

The PC contents are used as a branch destination address. Program execution starts from that address. Therefore, a reset start can be performed from an arbitrary address.

The contents of each register can be set by software, as required.

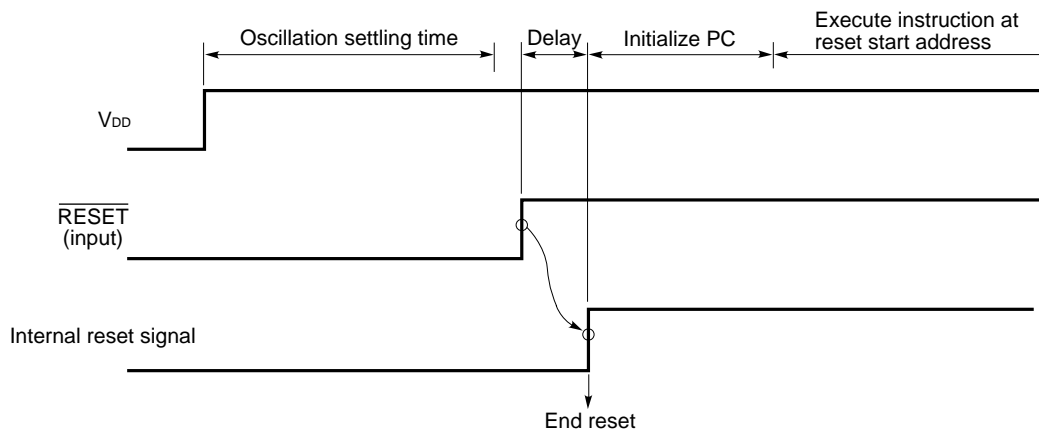

The $\overline{\text{RESET}}$ input circuit contains a noise eliminator to prevent malfunctions caused by noise. This noise eliminator is an analog delay sampling circuit.

Figure 12-1. Accepting a Reset

For power-on reset, the $\overline{\text{RESET}}$ signal must be held active until the oscillation settling time (approximately 40 ms) has elapsed.

Figure 12-2. Power-On Reset

13. INSTRUCTION SET

(1) 8-bit instructions (The instructions enclosed in parentheses are implemented by a combination of operands, where A is described as r.)

MOV, XCH, ADD, ADDC, SUB, SUBC, AND, OR, XOR, CMP, MULU, DIVUW, INC, DEC, ROR, ROL, RORC, ROLC, SHR, SHL, ROR4, ROL4, DBNZ, PUSH, POP, MOVW, XCHM, CMPME, CMPMNE, CMPMNC, CMPMC, MOVBK, XCHBK, CMPBKE, CMPBKNE, CMPBKNC, CMPBKC, CHKL, CHKLA

★ 14. ELECTRICAL CHARACTERISTICS

ABSOLUTE MAXIMUM RATINGS (T_A = 25 °C)

Parameter	Symbol	Conditions	Rating	Unit
Supply voltage	V _{DD}		-0.5 to +7.0	V
	AV _{DD}		AV _{SS} to V _{DD} + 0.5	V
	AV _{SS}		-0.5 to +0.5	V
Input voltage	V _I		-0.5 to V _{DD} + 0.5	V
Output voltage	V _O		-0.5 to V _{DD} + 0.5	V
Output low current	I _{OL}	At one pin	15	mA
		Total of all output pins	100	mA
Output high current	I _{OH}	At one pin	-10	mA
		Total of all output pins	-100	mA
A/D converter reference input voltage	AV _{REF1}		-0.5 to V _{DD} + 0.3	V
D/A converter reference input voltage	AV _{REF2}		-0.5 to V _{DD} + 0.3	V
	AV _{REF3}		-0.5 to V _{DD} + 0.3	V
Operating ambient temperature	T _A		-40 to +85	°C
Storage temperature	T _{stg}		-65 to +150	°C

Caution Absolute maximum ratings are rated values beyond which physical damage will be caused to the product; if the rated value of any of the parameters in the above table is exceeded, even momentarily, the quality of the product may deteriorate. Always use the product within its rated values.

OPERATING CONDITIONS

- Operating ambient temperature (T_A) : -40 to +85 °C
- Rise time and fall time (t_r, t_f) (at pins which are not specified) : 0 to 200 μs
- Power supply voltage and clock cycle time : See **Figure 14-1**.

Figure 14-1. Power Supply Voltage and Clock Cycle Time

CAPACITANCE (T_A = 25 °C, V_{DD} = V_{SS} = 0 V)

Parameter	Symbol	Conditions	MIN.	TYP.	MAX.	Unit
Input capacitance	C _i	f = 1 MHz			10	pF
Output capacitance	C _o	0 V on pins other than measured pins			10	pF
I/O capacitance	C _{io}				10	pF

OSCILLATOR CHARACTERISTICS ($T_A = -40$ to $+85$ °C, $V_{DD} = +4.5$ to 5.5 V, $V_{SS} = 0$ V)

Resonator	Recommended circuit	Parameter	MIN.	MAX.	Unit
Ceramic resonator or crystal		Oscillator frequency (f_{xx})	4	32	MHz
		External clock		X1 input frequency (f_x)	4
		X1 input rise and fall times (t_{xR} , t_{xF})	0	10	ns
		X1 input high-level and low-level widths (t_{WXH} , t_{WXL})	10	125	ns

Caution When using the system clock generator, run wires in the portion surrounded by broken lines according to the following rules to avoid effects such as stray capacitance:

- Minimize the wiring.
- Never cause the wires to cross other signal lines.
- Never cause the wires to run near a line carrying a large varying current.
- Cause the grounding point of the capacitor of the oscillator circuit to have the same potential as V_{SS1} . Never connect the capacitor to a ground pattern carrying a large current.
- Never extract a signal from the oscillator.

OSCILLATOR CHARACTERISTICS ($T_A = -40$ to $+85$ °C, $V_{DD} = +2.7$ to 5.5 V, $V_{SS} = 0$ V)

Resonator	Recommended circuit	Parameter	MIN.	MAX.	Unit
Ceramic resonator or crystal		Oscillator frequency (f_{xx})	4	16	MHz
External clock		X1 input frequency (f_x)	4	16	MHz
		X1 input rise and fall times (t_{XR} , t_{XF})	0	10	ns
		X1 input high-level and low-level widths (t_{WXH} , t_{WXL})	10	125	ns

Caution When using the system clock generator, run wires in the portion surrounded by broken lines according to the following rules to avoid effects such as stray capacitance:

- Minimize the wiring.
- Never cause the wires to cross other signal lines.
- Never cause the wires to run near a line carrying a large varying current.
- Cause the grounding point of the capacitor of the oscillator circuit to have the same potential as V_{SS1} . Never connect the capacitor to a ground pattern carrying a large current.
- Never extract a signal from the oscillator.

DC CHARACTERISTICS ($T_A = -40$ to $+85$ °C, $V_{DD} = AV_{DD} = +2.7$ to 5.5 V, $V_{SS} = AV_{SS} = 0$ V) (1/2)

Parameter	Symbol	Conditions	MIN.	TYP.	MAX.	Unit

(2) Bus hold timing

Parameter	Symbol	Conditions	MIN.	MAX.	Unit
Delay from $\overline{HLDRQ}_{\infty}$ to float	t _{FHQC}			(6 + a + n) T + 50	ns
Delay from $\overline{HLDRQ}_{\infty}$ to $\overline{HLDAK}_{\infty}$	t _{DHQHHAH}	V _{DD} = +5.0 V ± 10 %		(7 + a + n) T + 30	ns
				(7 + a + n) T + 40	ns
Delay from float to $\overline{HLDAK}_{\infty}$	t _{DCFHA}			1T + 30	ns
Delay from $\overline{HLDRQ}_{\downarrow}$ to $\overline{HLDAK}_{\downarrow}$	t _{DHQLHAL}	V _{DD} = +5.0 V ± 10 %		2T + 40	ns
				2T + 60	ns
Delay from $\overline{HLDAK}_{\downarrow}$ to active	t _{DHAC}	V _{DD} = +5.0 V ± 10 %	1T - 20		ns
			1T - 30		ns

Remarks T: T_{CYK} (system clock cycle time)
 a: 1 (during address wait), otherwise, 0
 n: Number of wait states (n • 0)

(3) External wait timing

Parameter	Symbol	Conditions	MIN.	MAX.	Unit
Delay from address to $\overline{\text{WAIT}}\downarrow$ input	t_{DAWT}	$V_{\text{DD}} = +5.0 \text{ V} \pm 10 \%$		$(2 + a) T - 40$	ns
				$(2 + a) T - 60$	ns
Delay from $\text{ASTB}\downarrow$ to $\overline{\text{WAIT}}\downarrow$ input	t_{DSTWT}	$V_{\text{DD}} = +5.0 \text{ V} \pm 10 \%$		$1.5T - 40$	ns
				$1.5T - 60$	ns
Hold time from $\text{ASTB}\downarrow$ to $\overline{\text{WAIT}}$	t_{HSTWTH}	$V_{\text{DD}} = +5.0 \text{ V} \pm 10 \%$	$(0.5 + n) T + 5$		ns
			$(0.5 + n) T + 10$		ns
Delay from $\text{ASTB}\downarrow$ to $\overline{\text{WAIT}}\infty$	t_{DSTWTH}	$V_{\text{DD}} = +5.0 \text{ V} \pm 10 \%$		$(1.5 + n) T - 40$	ns
				$(1.5 + n) T - 60$	ns
Delay from $\overline{\text{RD}}\downarrow$ to $\overline{\text{WAIT}}\downarrow$ input	t_{DRWTL}	$V_{\text{DD}} = +5.0 \text{ V} \pm 10 \%$		$T - 50$	ns
				$T - 70$	ns
Hold time from $\overline{\text{RD}}\downarrow$ to $\overline{\text{WAIT}}\downarrow$	t_{HRWT}	$V_{\text{DD}} = +5.0 \text{ V} \pm 10 \%$	$nT + 5$		ns
			$nT + 10$		ns
Delay from $\overline{\text{RD}}\downarrow$ to $\overline{\text{WAIT}}\infty$	t_{DRWTH}	$V_{\text{DD}} = +5.0 \text{ V} \pm 10 \%$		$(1 + n) T - 40$	ns
				$(1 + n) T - 60$	ns
Delay from $\overline{\text{WAIT}}\infty$ to data input	t_{DWTID}	$V_{\text{DD}} = +5.0 \text{ V} \pm 10 \%$		$0.5T - 5$	ns
				$0.5T - 10$	ns
Delay from $\overline{\text{WAIT}}\infty$ to $\overline{\text{WR}}\infty$	t_{DWTW}		$0.5T$		ns
Delay from $\overline{\text{WAIT}}\infty$ to $\overline{\text{RD}}\infty$	t_{DWTR}		$0.5T$		ns
Delay from $\overline{\text{WR}}\downarrow$ to $\overline{\text{WAIT}}\downarrow$ input	t_{DWWTL}	$V_{\text{DD}} = +5.0 \text{ V} \pm 10 \%$		$T - 50$	ns
				$T - 75$	ns
Hold time from $\overline{\text{WR}}\downarrow$ to $\overline{\text{WAIT}}$	t_{HWWT}	$V_{\text{DD}} = +5.0 \text{ V} \pm 10 \%$	$nT + 5$		ns
			$nT + 10$		ns
Delay from $\overline{\text{WR}}\downarrow$ to $\overline{\text{WAIT}}\infty$	t_{DWWTH}	$V_{\text{DD}} = +5.0 \text{ V} \pm 10 \%$		$(1 + n) T - 40$	ns
				$(1 + n) T - 70$	ns

Remarks T: T_{CYK} (system clock cycle time)
a: 1 (during address wait), otherwise, 0
n: Number of wait states ($n \cdot 0$)

(4) Refresh timing

Parameter	Symbol	Conditions	MIN.	MAX.	Unit
Random read/write cycle time	t_{RC}		$3T$		ns
$\overline{\text{REFRQ}}$ low-level pulse width	t_{WRFQL}	$V_{\text{DD}} = +5.0 \text{ V} \pm 10 \%$	$1.5T - 25$		ns
			$1.5T - 30$		ns
Delay from $\text{ASTB}\downarrow$ to $\overline{\text{REFRQ}}$	t_{DSTRFQ}		$0.5T - 9$		ns
Delay from $\overline{\text{RD}}\infty$ to $\overline{\text{REFRQ}}$	t_{DRRFQ}		$1.5T - 9$		ns
Delay from $\overline{\text{WR}}\infty$ to $\overline{\text{REFRQ}}$	t_{DWRFQ}		$1.5T - 9$		ns
Delay from $\overline{\text{REFRQ}}\infty$ to ASTB	t_{DRFQST}		$0.5T - 15$		ns
$\overline{\text{REFRQ}}$ high-level pulse width	t_{WRFQH}	$V_{\text{DD}} = +5.0 \text{ V} \pm 10 \%$	$1.5T - 25$		ns
			$1.5T - 30$		ns

Remark T: T_{CYK} (system clock cycle time)

SERIAL OPERATION ($T_A = -40$ to $+85$ °C, $V_{DD} = +2.7$ to 5.5 V, $AV_{SS} = V_{SS} = 0$ V)

(1) CSI

Parameter	Symbol	Conditions		MIN.	MAX.	Unit
Serial clock cycle time ($\overline{SCK0}$)	t_{CYSK0}	Input	External clock When $\overline{SCK0}$ and $S00$ are CMOS I/O	$10/f_{XX} + 380$		ns
		Output		T		μs
Serial clock low-level width ($\overline{SCK0}$)	t_{WSK0L}	Input	External clock When $\overline{SCK0}$ and $S00$ are CMOS I/O	$5/f_{XX} + 150$		ns
		Output		$0.5T - 40$		μs
Serial clock high-level width ($\overline{SCK0}$)	t_{WSK0H}	Input	External clock When $\overline{SCK0}$ and $S00$ are CMOS I/O	$5/f_{XX} + 150$		ns
		Output		$0.5T - 40$		μs
SIO setup time (to $\overline{SCK0\infty}$)	t_{SSSK0}			40		ns
SIO hold time (to $\overline{SCK0\infty}$)	t_{HSSK0}			$5/f_{XX} + 40$		ns
S00 output delay time (to $\overline{SCK0\downarrow}$)	t_{DSBSK1}	CMOS push-pull output (3-wire serial I/O mode)		0	$5/f_{XX} + 150$	ns
	t_{DSBSK2}	Open-drain output (2-wire serial I/O mode), $R_L = 1$ kΩ		0	$5/f_{XX} + 400$	ns

- Remarks**
1. The values in this table are those when C_L is 100 pF.
 2. T : Serial clock cycle set by software. The minimum value is $16/f_{XX}$.
 3. f_{XX} : Oscillator frequency

(2) IOE1, IOE2

Parameter	Symbol	Conditions		MIN.	MAX.	Unit
Serial clock cycle time ($\overline{\text{SCK1}}$, $\overline{\text{SCK2}}$)	tcYSK1	Input	V _{DD} = +5.0 V ± 10 %	250		ns
				500		ns
	Output	Internal, divided by 16	T		ns	
Serial clock low-level width ($\overline{\text{SCK1}}$, $\overline{\text{SCK2}}$)	twSKL1	Input	V _{DD} = +5.0 V ± 10 %	85		ns
				210		ns
	Output	Internal, divided by 16	0.5T - 40		ns	
Serial clock high-level width ($\overline{\text{SCK1}}$, $\overline{\text{SCK2}}$)	twSKH1	Input	V _{DD} = +5.0 V ± 10 %	85		ns
				210		ns
	Output	Internal, divided by 16	0.5T - 40		ns	
Setup time for SI1 and SI2 (to $\overline{\text{SCK1}}$, $\overline{\text{SCK2}}_{\infty}$)	tSSK1			40		ns
Hold time for SI1 and SI2 (to $\overline{\text{SCK1}}$, $\overline{\text{SCK2}}_{\infty}$)	tHSSK1			40		ns
Output delay time for SO1 and SO2 (to $\overline{\text{SCK1}}$, $\overline{\text{SCK2}}_{\downarrow}$)	tDSOSK			0	50	ns
Output hold time for SO1 and SO2 (to $\overline{\text{SCK1}}$, $\overline{\text{SCK2}}_{\infty}$)	tHSOSK	When data is transferred		0.5tcYSK1 - 40		ns

Remarks 1. The values in this table are those when C_L is 100 pF.

2. T: Serial clock cycle set by software. The minimum value is 16/f_{xx}.

(3) UART, UART2

Parameter	Symbol	Conditions	MIN.	MAX.	Unit
ASCK clock input cycle time	tcYASK	V _{DD} = +5.0 V ± 10 %	125		ns
			250		ns
ASCK clock low-level width	twASKL	V _{DD} = +5.0 V ± 10 %	52.5		ns
			85		ns
ASCK clock high-level width	twASKH	V _{DD} = +5.0 V ± 10 %	52.5		ns
			85		ns

OTHER OPERATIONS

Parameter	Symbol	Conditions	MIN.	MAX.	Unit
NMI low-level width	t _{WNIL}		10		μs
NMI high-level width	t _{WNIH}		10		μs
INTP0 low-level width	t _{WIT0L}		3t _{CYAMP} + 10		ns
INTP0 high-level width	t _{WIT0H}		3t _{CYAMP} + 10		ns
Low-level width for INTP1-INTP3 and CI	t _{WIT1L}		3t _{CYCPU} + 10		ns
High-level width for INTP1-INTP3 and CI	t _{WIT1H}		3t _{CYCPU} + 10		ns
Low-level width for INTP4 and INTP5	t _{WIT2L}		10		μs
High-level width for INTP4 and INTP5	t _{WIT2H}		10		μs
RESET low-level width	t _{WRSL}		10		μs
RESET high-level width	t _{WRSH}		10		μs

Remarks t_{CYAMP}: Sampling clock set by software
t_{CYCPU}: CPU operation clock set by software in the CPU

A/D CONVERTER CHARACTERISTICS

(T_A = -40 to +85 °C, V_{DD} = AV_{DD} = AV_{REF1} = +2.7 to 5.5 V, V_{SS} = AV_{SS} = 0 V)

Parameter	Symbol	Conditions	MIN.	TYP.	MAX.	Unit
Resolution			8			bit
Total error ^{Note}					1.0	%
Linearity calibration ^{Note}					0.8	%
Quantization error					±1/2	LSB
Conversion time	t _{CONV}	FR = 1	120			t _{CYK}
		FR = 0	180			t _{CYK}
Sampling time	t _{SAMP}	FR = 1	24			t _{CYK}
		FR = 0	36			t _{CYK}
Analog input voltage	V _{IAN}		-0.3		AV _{REF1} + 0.3	V
Analog input impedance	R _{AN}			1 000		MΩ
AV _{REF1} current	I _{REF1}			0.5	1.5	mA
AV _{DD} supply current	A _{DD1}	f _{XX} = 32 MHz, CS = 1		2.0	5.0	mA
	A _{DD2}	STOP mode, CS = 0		1.0	20	μA

Note Quantization error is not included. This parameter is indicated as the ratio to the full-scale value.

Remark t_{CYK}: System clock cycle time

D/A CONVERTER CHARACTERISTICS ($T_A = -40$ to $+85$ °C, $V_{DD} = AV_{DD} = +2.7$ to 5.5 V, $V_{SS} = AV_{SS} = 0$ V)

Parameter	Symbol	Conditions	MIN.	TYP.	MAX.	Unit	
Resolution			8			bit	
Total error		Load conditions: 4 MΩ, 30 pF	$V_{DD} = AV_{DD} = AV_{REF2} = +2.7$ to 5.5 V $AV_{REF3} = 0$ V			0.6	%
			$V_{DD} = AV_{DD} = +2.7$ to 5.5 V $AV_{REF2} = 0.75V_{DD}$ $AV_{REF3} = 0.25V_{DD}$			0.8	%
		Load conditions: 2 MΩ, 30 pF	$V_{DD} = AV_{DD} = AV_{REF2} = +2.72.7$ to 5.5 V $AV_{REF3} = 0$ V			0.8	%
			$V_{DD} = AV_{DD} = +2.7$ to 5.5 V $AV_{REF2} = 0.75V_{DD}$ $AV_{REF3} = 0.25V_{DD}$			1.0	%
Settling time		Load conditions: 2 MΩ, 30 pF			10	μs	
Output resistance	R_o	DACS0, 1 = 55 H		10		kΩ	
Analog reference voltage	AV_{REF2}		$0.75V_{DD}$		V_{DD}	V	
	AV_{REF3}		0		$0.25V_{DD}$	V	
Resistance of AV_{REF2} and AV_{REF3}	R_{AIREF}	DACS0, 1 = 55 H	4	8		kΩ	
Reference power supply input current	AI_{REF2}		0		5	mA	
	AI_{REF3}		-5		0	mA	

DATA RETENTION CHARACTERISTICS (T_A = -40 to +85 °C)

Parameter	Symbol	Conditions	MIN.	TYP.	MAX.	Unit
Data retention voltage	V _{DDDR}	STOP mode	2.5		5.5	V
Data retention current	I _{DDDR}	V _{DDDR} = +2.7 to 5.5 V		10	50	μA
		V _{DDDR} = +2.5 V		2	10	μA
V _{DD} rise time	t _{RVD}		200			μs
V _{DD} fall time	t _{FVD}		200			μs
V _{DD} hold time (to STOP mode setting)	t _{HVD}		0			ms
STOP clear signal input time	t _{DREL}		0			ms
Oscillation settling time	t _{WAIT}	Crystal	30			ms
		Ceramic resonator	5			ms
Input low voltage	V _{IL}	Specific pins ^{Note}	0		0.1V _{DDDR}	V
Input high voltage	V _{IH}		0.9V _{DDDR}		V _{DDDR}	V

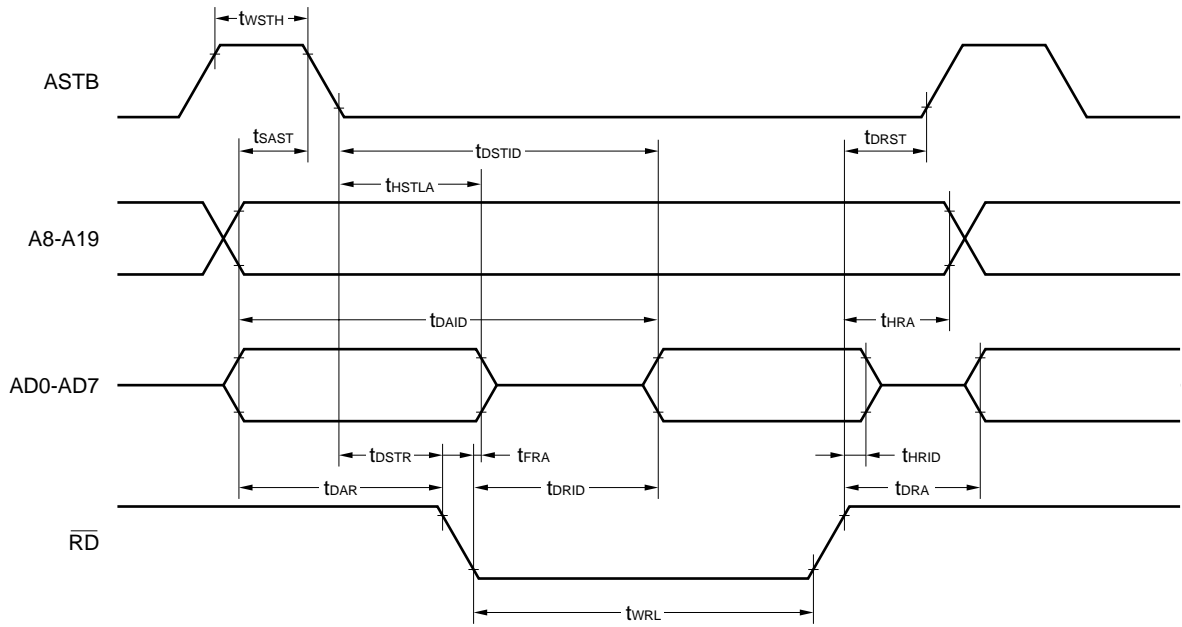

Note $\overline{\text{RESET}}$, P20/NMI, P21/INTP0, P22/INTP1, P23/INTP2/CI, P24/INTP3, P25/INTP4/ASCK/SCK1, P26/INTP5, P27/SI0, P32/ $\overline{\text{SCK0}}$ /SCL, and P33/SO0/SDA pins

★ 16. RECOMMENDED SOLDERING CONDITIONS

The conditions listed below shall be met when soldering the μPD784031.

For details of the recommended soldering conditions, refer to our document **Semiconductor Device Mounting Technology Manual (C10535E)**.

Please consult with our sales offices in case any other soldering process is used, or in case soldering is done under different conditions.

Table 16-1. Soldering Conditions for Surface-Mount Devices (1/2)

(1) μPD784031GC-3B9: 80-pin plastic QFP (14 × 14 × 2.7 mm)

Soldering process	Soldering conditions	Symbol
Infrared ray reflow	Peak package's surface temperature: 235 °C Reflow time: 30 seconds or less (210 °C or more) Maximum allowable number of reflow processes: 3	IR35-00-3
VPS	Peak package's surface temperature: 215 °C Reflow time: 40 seconds or less (200 °C or more) Maximum allowable number of reflow processes: 3	VP15-00-3
Wave soldering	Solder temperature: 260 °C or less Flow time: 10 seconds or less Number of flow processes: 1 Preheating temperature : 120 °C max. (measured on the package surface)	WS60-00-1
Partial heating method	Terminal temperature: 300 °C or less Heat time: 3 seconds or less (for one side of a device)	-

Caution Do not apply two or more different soldering methods to one chip (except for partial heating method for terminal sections).

(2) μPD784031GC-8BT: 80-pin plastic QFP (14 × 14 × 1.4 mm)

Soldering process	Soldering conditions	Symbol
Infrared ray reflow	Peak package's surface temperature: 235 °C Reflow time: 30 seconds or less (210 °C or more) Maximum allowable number of reflow processes: 2	IR35-00-2
VPS	Peak package's surface temperature: 215 °C Reflow time: 40 seconds or less (200 °C or more) Maximum allowable number of reflow processes: 2	VP15-00-2
Wave soldering	Solder temperature: 260 °C or less Flow time: 10 seconds or less Number of flow processes: 1 Preheating temperature : 120 °C max. (measured on the package surface)	WS60-00-1
Partial heating method	Terminal temperature: 300 °C or less Heat time: 3 seconds or less (for one side of a device)	-

Caution Do not apply two or more different soldering methods to one chip (except for partial heating method for terminal sections).

Table 16-1. Soldering Conditions for Surface-Mount Devices (2/2)

(3) μPD784031GK-BE9: 80-pin plastic TQFP (fine pitch) (12 × 12 mm)

Soldering process	Soldering conditions	Symbol
Infrared ray reflow	Peak package's surface temperature: 235 °C Reflow time: 30 seconds or less (210 °C or more) Maximum allowable number of reflow processes: 2 Exposure limit: 7 days ^{Note} (10 hours of pre-baking is required at 125 °C afterward) <Caution> Non-heat-resistant trays, such as magazine and taping trays, cannot be baked before unpacking.	IR35-107-2
VPS	Peak package's surface temperature: 215 °C Reflow time: 40 seconds or less (200 °C or more) Maximum allowable number of reflow processes: 2 Exposure limit: 7 days ^{Note} (10 hours of pre-baking is required at 125 °C afterward) <Caution> Non-heat-resistant trays, such as magazine and taping trays, cannot be baked before unpacking.	VP15-107-2
Partial heating method	Terminal temperature: 300 °C or less Heat time: 3 seconds or less (for one side of a device)	-

Note Maximum number of days during which the product can be stored at a temperature of 25 °C and a relative humidity of 65 % or less after dry-pack package is opened.

Caution Do not apply two or more different soldering methods to one chip (except for partial heating method for terminal sections).

APPENDIX A DEVELOPMENT TOOLS

The following development tools are available for system development using the μPD784031.

Language Processing Software

RA78K4 ^{Note 1}	Assembler package for all 78K/IV series models
CC78K4 ^{Note 1}	C compiler package for all 78K/IV series models
CC78K4-L ^{Note 1}	C compiler library source file for all 78K/IV series models

PROM Write Tools

PG-1500	PROM programmer
PA-78P4026GC PA-78P4038GK PA-78P4026KK	Programmer adaptor, connects to PG-1500
PG-1500 controller ^{Note 2}	Control program for PG-1500

Debugging Tools

IE-784000-R	In-circuit emulator for all 78K/IV sub-series models
IE-784000-R-BK	Break board for all 78K/IV series models
IE-784038-R-EM1 IE-784000-R-EM	Emulation board for evaluating μPD784038 sub-series models
IE-70000-98-IF-B	Interface adapter when the PC-9800 series computer (other than a notebook) is used as the host machine
IE-70000-98N-IF	Interface adapter and cable when a PC-9800 series notebook is used as the host machine
IE-70000-PC-IF-B	Interface adapter when the IBM PC/AT™ is used as the host machine
IE-78000-R-SV3	Interface adapter and cable when the EWS is used as the host machine
EP-78230GC-R	Emulation probe for 80-pin plastic QFP (GC-3B9 and GC-8BT types) for all μPD784038 sub-series
EP-78054GK-R	Emulation probe for 80-pin plastic TQFP (fine pitch) (GK-BE9 type) for all μPD784038 sub-series
EV-9200GC-80	Socket for mounting on target system board made for 80-pin plastic QFP (GC-3B9 and GC-8BT types)
TGK-080SDW	Adapter for mounting on target system board made for 80-pin plastic TQFP (fine pitch) (GK-BE9 type)
EV-9900	Tool used to remove the μPD78P4038KK-T from the EV-9200GC-80
SM78K4 ^{Note 3}	System simulator for all 78K/IV series models
ID78K4 ^{Note 3}	Integrated debugger for IE-784000-R
DF784038 ^{Note 4}	Device file for all μPD784038 sub-series models

Real-Time OS

RX78K/IV ^{Note 4}	Real-time OS for 78K/IV series models
MX78K4 ^{Note 2}	OS for all 78K/IV series models

- Notes 1.**
- Based on PC-9800 series (MS-DOST™)
 - Based on IBM PC/AT and compatibles (PC DOST™, Windows™, MS-DOS, and IBM DOST™)
 - Based on HP9000 series 700™ (HP-UXTM)
 - Based on SPARCstation™ (SunOST™)
 - Based on NEWST™ (NEWS-OST™)
- 2.**
- Based on PC-9800 series (MS-DOS)
 - Based on IBM PC/AT and compatibles (PC DOS, Windows, MS-DOS, and IBM DOS)
- 3.**
- Based on PC-9800 series (MS-DOS + Windows)
 - Based on IBM PC/AT and compatibles (PC DOS, Windows, MS-DOS, and IBM DOS)
 - Based on HP9000 series 700 (HP-UX)
 - Based on SPARCstation (SunOS)
- 4.**
- Based on PC-9800 series (MS-DOS)
 - Based on IBM PC/AT and compatibles (PC DOS, Windows, MS-DOS, and IBM DOS)
 - Based on HP9000 series 700 (HP-UX)
 - Based on SPARCstation (SunOS)

- Remarks 1.** The RA78K4, CC78K4, SM78K4, and ID78K4 are used with the DF784038.
- 2.** The TGK-080SDW is a product of TOKYO ELETECH CORPORATION (Tokyo, 03-5295-1661). Consult the NEC sales representative for purchasing.

[MEMO]

NOTES FOR CMOS DEVICES

① PRECAUTION AGAINST ESD FOR SEMICONDUCTORS

Note: Strong electric field, when exposed to a MOS device, can cause destruction of the gate oxide and ultimately degrade the device operation. Steps must be taken to stop generation of static electricity as much as possible, and quickly dissipate it once, when it has occurred. Environmental control must be adequate. When it is dry, humidifier should be used. It is recommended to avoid using insulators that easily build static electricity. Semiconductor devices must be stored and transported in an anti-static container, static shielding bag or conductive material. All test and measurement tools including work bench and floor should be grounded. The operator should be grounded using wrist strap. Semiconductor devices must not be touched with bare hands. Similar precautions need to be taken for PW boards with semiconductor devices on it.

② HANDLING OF UNUSED INPUT PINS FOR CMOS

Note: No connection for CMOS device inputs can be cause of malfunction. If no connection is provided to the input pins, it is possible that an internal input level may be generated due to noise, etc., hence causing malfunction. CMOS device behave differently than Bipolar or NMOS devices. Input levels of CMOS devices must be fixed high or low by using a pull-up or pull-down circuitry. Each unused pin should be connected to V_{DD} or GND with a resistor, if it is considered to have a possibility of being an output pin. All handling related to the unused pins must be judged device by device and related specifications governing the devices.

③ STATUS BEFORE INITIALIZATION OF MOS DEVICES

Note: Power-on does not necessarily define initial status of MOS device. Production process of MOS does not define the initial operation status of the device. Immediately after the power source is turned ON, the devices with reset function have not yet been initialized. Hence, power-on does not guarantee out-pin levels, I/O settings or contents of registers. Device is not initialized until the reset signal is received. Reset operation must be executed immediately after power-on for devices having reset function.

Regional Information

Some information contained in this document may vary from country to country. Before using any NEC product in your application, please contact the NEC office in your country to obtain a list of authorized representatives and distributors. They will verify:

- Device availability
- Ordering information
- Product release schedule
- Availability of related technical literature
- Development environment specifications (for example, specifications for third-party tools and components, host computers, power plugs, AC supply voltages, and so forth)
- Network requirements

In addition, trademarks, registered trademarks, export restrictions, and other legal issues may also vary from country to country.

Some related documents may be preliminary versions. Note that, however, what documents are preliminary is not indicated in this document.

No part of this document may be copied or reproduced in any form or by any means without the prior written consent of NEC Corporation. NEC Corporation assumes no responsibility for any errors which may appear in this document.

NEC Corporation does not assume any liability for infringement of patents, copyrights or other intellectual property rights of third parties by or arising from use of a device described herein or any other liability arising from use of such device. No license, either express, implied or otherwise, is granted under any patents, copyrights or other intellectual property rights of NEC Corporation or others.

While NEC Corporation has been making continuous effort to enhance the reliability of its semiconductor devices, the possibility of defects cannot be eliminated entirely. To minimize risks of damage or injury to persons or property arising from a defect in an NEC semiconductor device, customers must incorporate sufficient safety measures in its design, such as redundancy, fire-containment, and anti-failure features.

NEC devices are classified into the following three quality grades:

"Standard", "Special", and "Specific". The Specific quality grade applies only to devices developed based on a customer designated "quality assurance program" for a specific application. The recommended applications of a device depend on its quality grade, as indicated below. Customers must check the quality grade of each device before using it in a particular application.

Standard: Computers, office equipment, communications equipment, test and measurement equipment, audio and visual equipment, home electronic appliances, machine tools, personal electronic equipment and industrial robots

Special: Transportation equipment (automobiles, trains, ships, etc.), traffic control systems, anti-disaster systems, anti-crime systems, safety equipment and medical equipment (not specifically designed for life support)

Specific: Aircrafts, aerospace equipment, submersible repeaters, nuclear reactor control systems, life support systems or medical equipment for life support, etc.

The quality grade of NEC devices is "Standard" unless otherwise specified in NEC's Data Sheets or Data Books. If customers intend to use NEC devices for applications other than those specified for Standard quality grade, they should contact an NEC sales representative in advance.

Anti-radioactive design is not implemented in this product.
