

8-BIT SINGLE-CHIP MICROCONTROLLER

DESCRIPTION

The μ PD78P058FY is an Electro Magnetic Interference (EMI) noise reduction version of the μ PD78P058Y.

The μ PD78P058FY is a member of the μ PD78058FY Subseries of the 78K/0 Series, in which the on-chip mask ROM of the μ PD78058FY is replaced with one-time programmable (OTP) ROM.

Because this device can be programmed by users, it is suited for applications involving the small-scale production of many different products, and for rapid development and time-to-market of new products.

Details are given in the following User's Manuals. Be sure to read them before starting design.

μ PD78058F, 78058FY Subseries User's Manual : U12068E

78K/0 Series User's Manual Instructions : U12326E

FEATURES

- EMI noise reduction version (overall peak level reduced by 5 to 10 dB)
- Pin compatible with mask ROM versions (except the V_{PP} pin)
- Internal PROM : 60 Kbytes^{Note 1}
Programmable once only (ideal for small-scale production)
- Internal high-speed RAM : 1024 bytes
- Internal expansion RAM : 1024 bytes^{Note 2}
- Buffer RAM : 32 bytes
- Connectable I²C bus interface
- Operable in the same supply voltage range as mask ROM versions ($V_{DD} = 2.7$ to 6.0 V)
- One of the QTOP™ Microcontrollers

- Notes**
1. The internal PROM capacity can be changed with the memory size switching register (IMS).
 2. The internal expansion RAM capacity can be changed with the internal expansion RAM size switching register (IXS).

- Remarks**
1. For the difference between PROM and mask ROM versions, see **1. DIFFERENCES BETWEEN μ PD78P058FY AND MASK ROM VERSIONS.**
 2. QTOP Microcontroller is the general name of the microcontrollers with on-chip one-time PROM that are totally supported by the NEC writing service (from writing to marking, screening and testing).

1. DIFFERENCES BETWEEN μPD78P058FY AND MASK ROM VERSIONS

The μPD78P058FY is a single-chip microcontroller with an on-chip one-time PROM.

Setting the memory size switching register (IMS) and internal expansion RAM size switching register (IXS) enables identical functions to mask ROM versions (μPD78056FY and 78058FY) except the functions of PROM specifications and of mask options for P60 to P63.

Differences between the μPD78P058FY and mask ROM versions are shown in Table 1-1.

Table 1-1. Differences between μPD78P058FY and Mask ROM Versions

Item	μPD78P058FY	Mask ROM Versions
Internal ROM structure	One-time PROM	Mask ROM
Internal ROM capacity	60 Kbytes	μPD78056FY : 48 Kbytes μPD78058FY : 60 Kbytes
Internal expansion RAM capacity	1024 bytes	μPD78056FY : None μPD78058FY : 1024 bytes
Change of internal ROM capacity by memory size switching register (IMS)	Can be changed ^{Note}	Cannot be changed
Change of internal expansion RAM capacity by internal expansion RAM size switching register (IXS)	Can be changed ^{Note}	Cannot be changed
IC pin	None	Provided
V _{PP} pin	Provided	None
Pull-up resistor on-chip mask option of P60 to P63 pins	None	Provided
Electrical specifications, recommended soldering conditions	See each Data Sheet.	

Note The RESET input sets the internal PROM capacity and internal expansion RAM capacity to 60 Kbytes and 1024 bytes, respectively.

Caution The PROM version and mask ROM version differ in noise tolerance and noise emission. When replacing a PROM version with a mask ROM version when switching from experimental production to mass production, make a thorough evaluation with a CS version (not ES version) of the mask ROM version.

- Notes**
1. When the P07/XT1 pins are used as the input ports, set the processor clock control register (PCC) bit 6 (FRC) to 1, and be sure not to use the feedback resistor of the subsystem clock oscillation circuit.
 2. When the P10/ANI0 to P17/ANI7 pins are used as the analog inputs for A/D converter, set port 1 to input mode. The on-chip pull-up resistors are automatically disabled.

Caution For pins which also function as port pins, do not perform the following operations during A/D conversion. If these operations are performed, the total error ratings cannot be kept.

<1> Rewrite the output latch while the pin is used as a port pin.

<2> Change the output level of the pin used as an output pin, even if it is not used as a port pin.

(1) Port pins (2/2)

Pin Name	Input/Output	Function		After Reset	Alternate Function
P40 to P47	Input/output	Port 4 8-bit input/output port Input/output is specifiable as 8-bit unit. When used as the input port, it is possible to use an on-chip pull-up resistor by software. Set test input flag (KRIF) to 1 by falling edge detection.		Input	AD0 to AD7
P50 to P57	Input/output	Port 5 8-bit input/output port It is possible to directly drive LEDs. Input/output is specifiable bit-wise. When used as the input port, it is possible to use an on-chip pull-up resistor by software.		Input	A8 to A15

- Cautions**
1. The AVDD pin functions as both an A/D converter power supply and a port power supply. When the μPD78P058FY is used in applications where the noise generated inside the microcontroller needs to be reduced, connect the AVDD pin to another power supply which has the same potential as VDD.
 2. The AVSS pin functions as both grounds of an A/D converter and D/A converter and of a port. When the μPD78P058FY is used in applications where the noise generated inside the microcontroller needs to be reduced, connect the AVSS pin to a ground line other than Vss.

2.2 Pins in PROM Programming Mode

Pin Name	Input/Output	Function
$\overline{\text{RESET}}$	Input	PROM programming mode setting When +5 V or +12.5 V is applied to the V_{PP} pin and a low-level signal is applied to the $\overline{\text{RESET}}$ pin, this chip is set in the PROM programming mode.
V_{PP}	Input	PROM programming mode setting and high-voltage applied during program write/verification
A0 to A16	Input	Address bus
D0 to D7	Input/output	Data bus
$\overline{\text{CE}}$	Input	PROM enable input/program pulse input
$\overline{\text{OE}}$	Input	Read strobe input to PROM
$\overline{\text{PGM}}$	Input	Program/program inhibit input in PROM programming mode
V_{DD}	—	Positive power supply
V_{SS}	—	Ground potential

3. MEMORY SIZE SWITCHING REGISTER (IMS)

This is a register to disable use of part of internal memories by software. By setting this memory size switching register (IMS), it is possible to get the same memory mapping as that of a mask ROM version having different internal memories (ROM).

The IMS register is set with an 8-bit memory manipulation instruction.

$\overline{\text{RESET}}$ input sets IMS to CFH.

Figure 3-1. Memory Size Switching Register Format

Note Set the internal ROM capacity to 56 Kbytes or less when external device expansion function is used.

Table 3-1 shows the setting values of IMS which make the memory mapping the same as that of the mask ROM versions.

Table 3-1. Memory Size Switching Register Setting Values

Target Mask ROM Version	IMS Setting Value
μPD78056FY	CCH
μPD78058FY	CFH

4. INTERNAL EXPANSION RAM SIZE SWITCHING REGISTER (IXS)

This is a register to set the internal expansion RAM capacity by software. By setting this internal expansion RAM size switching register (IXS), it is possible to get the same memory mapping as that of a mask ROM version having different internal expansion RAM.

The IXS register is set with an 8-bit memory manipulation instruction.
 RESET input sets IXS to 0AH.

Figure 4-1. Internal Expansion RAM Size Switching Register Format

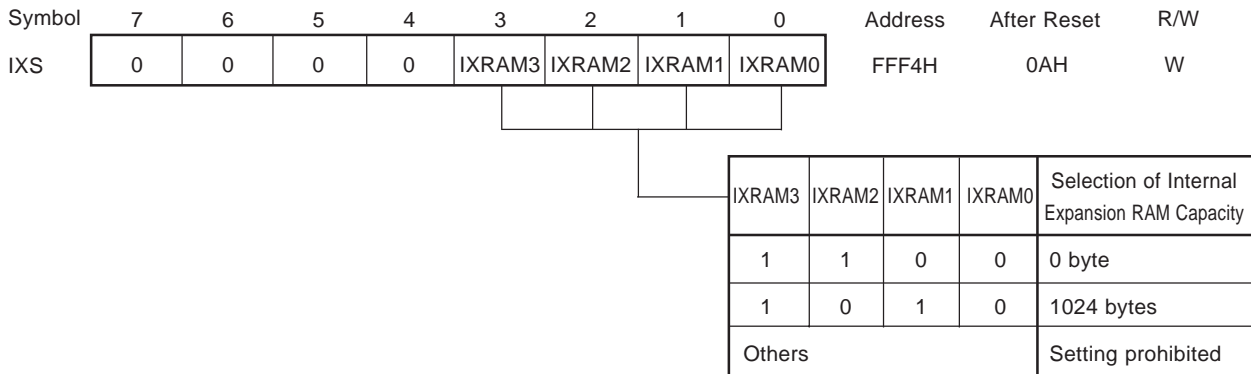

Table 4-1 shows the setting values of IXS which make the memory mapping the same as that of the mask ROM versions.

Table 4-1. Internal Expansion RAM Size Switching Register Setting Values

Target Mask ROM Version	IXS Setting Value
μPD78056FY	0CH
μPD78058FY	0AH

Remark Even if a μPD78P058FY program that includes “MOV IXS, #0CH” is implemented on the μPD78056FY, its operation will not be affected.

5. PROM PROGRAMMING

The μPD78P058FY has an on-chip 60-Kbyte PROM as a program memory. For programming, set the PROM programming mode by the V_{PP} and \overline{RESET} pins. For connecting unused pins, refer to **PIN CONFIGURATIONS (Top View) (2) PROM programming mode**.

Caution Program writing should be performed in the address range 0000H to EFFFH (the last address, EFFFH, should be specified). Writing cannot be performed with a PROM programmer that cannot specify the write addresses.

5.1 Operating Modes

When +5 V or +12.5 V is applied to the V_{PP} pin and a low level signal is applied to the \overline{RESET} pin, the PROM programming mode is set. This mode will become the operating mode as shown in Table 5-1 when the \overline{CE} , \overline{OE} and \overline{PGM} pins are set as shown.

Further, when the read mode is set, it is possible to read the contents of the PROM.

Table 5-1. Operating Modes of PROM Programming

Pin Operating Mode	\overline{RESET}	V_{PP}	V_{DD}	\overline{CE}	\overline{OE}	\overline{PGM}	D0 to D7
Page data latch	L	+12.5 V	+6.5 V	H	L	H	Data input
Page write				H	H	L	High-impedance
Byte write				L	H	L	Data input
Program verify				L	L	H	Data output
Program inhibit				×	H	H	High-impedance
				×	L	L	
Read	L	+5 V	+5 V	L	L	H	Data output
Output disable				L	H	×	High-impedance
Standby				H	×	×	High-impedance

Remark × : L or H

(1) Read mode

Read mode is set if $\overline{CE} = L$, $\overline{OE} = L$ are set.

(2) Output disable mode

Data output becomes high-impedance, and is in the output disable mode, if $\overline{OE} = H$ is set.

Therefore, it allows data to be read from any device by controlling the \overline{OE} pin, if multiple μ PD78P058FYs are connected to the data bus.

(3) Standby mode

Standby mode is set if $\overline{CE} = H$ is set.

In this mode, data outputs become high-impedance irrespective of the \overline{OE} status.

(4) Page data latch mode

Page data latch mode is set if $\overline{CE} = H$, $\overline{PGM} = H$, $\overline{OE} = L$ are set at the beginning of page write mode.

In this mode, 1-page 4-byte data is latched in an internal address/data latch circuit.

(5) Page write mode

After 1 page 4 bytes of addresses and data are latched in the page data latch mode, a page write is executed by applying a 0.1-ms program pulse (active low) to the \overline{PGM} pin with $\overline{CE} = H$, $\overline{OE} = H$. Then, program verification can be performed, if $\overline{CE} = L$, $\overline{OE} = L$ are set.

If programming is not performed by a one-time program pulse, X ($X \leq 10$) write and verification operations should be executed repeatedly.

(6) Byte write mode

Byte write is executed when a 0.1-ms program pulse (active low) is applied to the \overline{PGM} pin with $\overline{CE} = L$, $\overline{OE} = H$. Then, program verification can be performed if $\overline{OE} = L$ is set.

If programming is not performed by a one-time program pulse, X ($X \leq 10$) write and verification operations should be executed repeatedly.

(7) Program verify mode

Program verify mode is set if $\overline{CE} = L$, $\overline{PGM} = H$, $\overline{OE} = L$ are set.

In this mode, check if a write operation is performed correctly after the write.

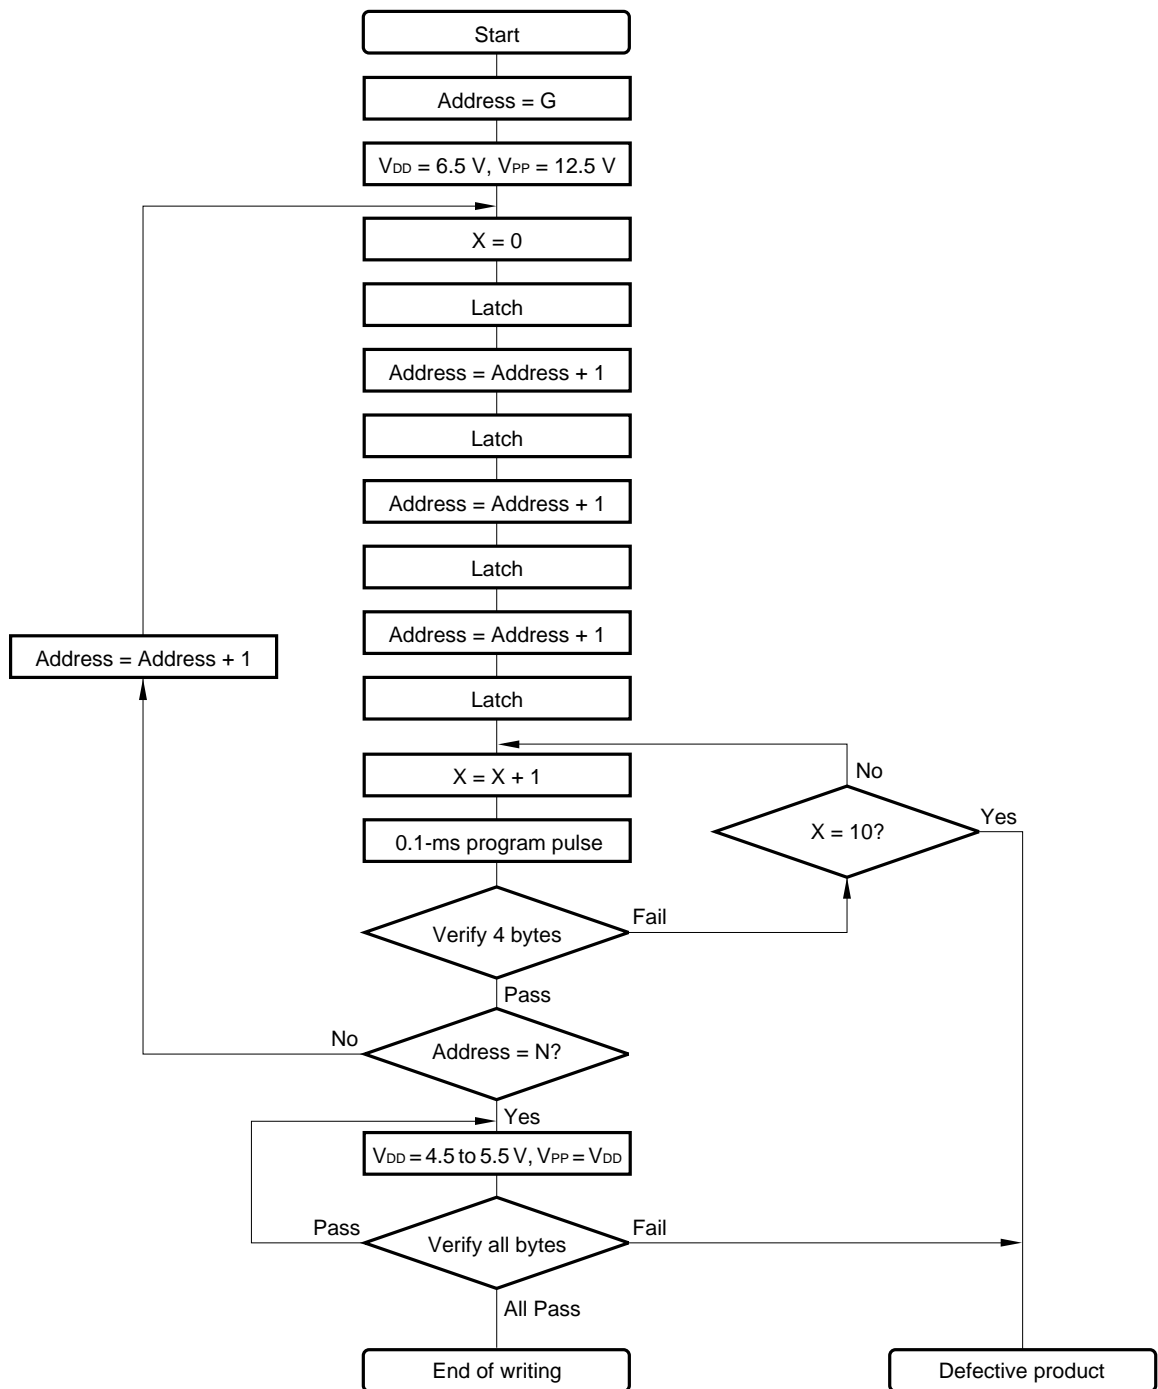

(8) Program inhibit mode

Program inhibit mode is used when the \overline{OE} pin, V_{PP} pin, and D0 to D7 pins of multiple μ PD78P058FYs are connected in parallel and a write is performed to one of those devices.

When a write operation is performed, the page write mode or byte write mode described above is used. At this time, a write is not performed to a device which has the \overline{PGM} pin driven high.

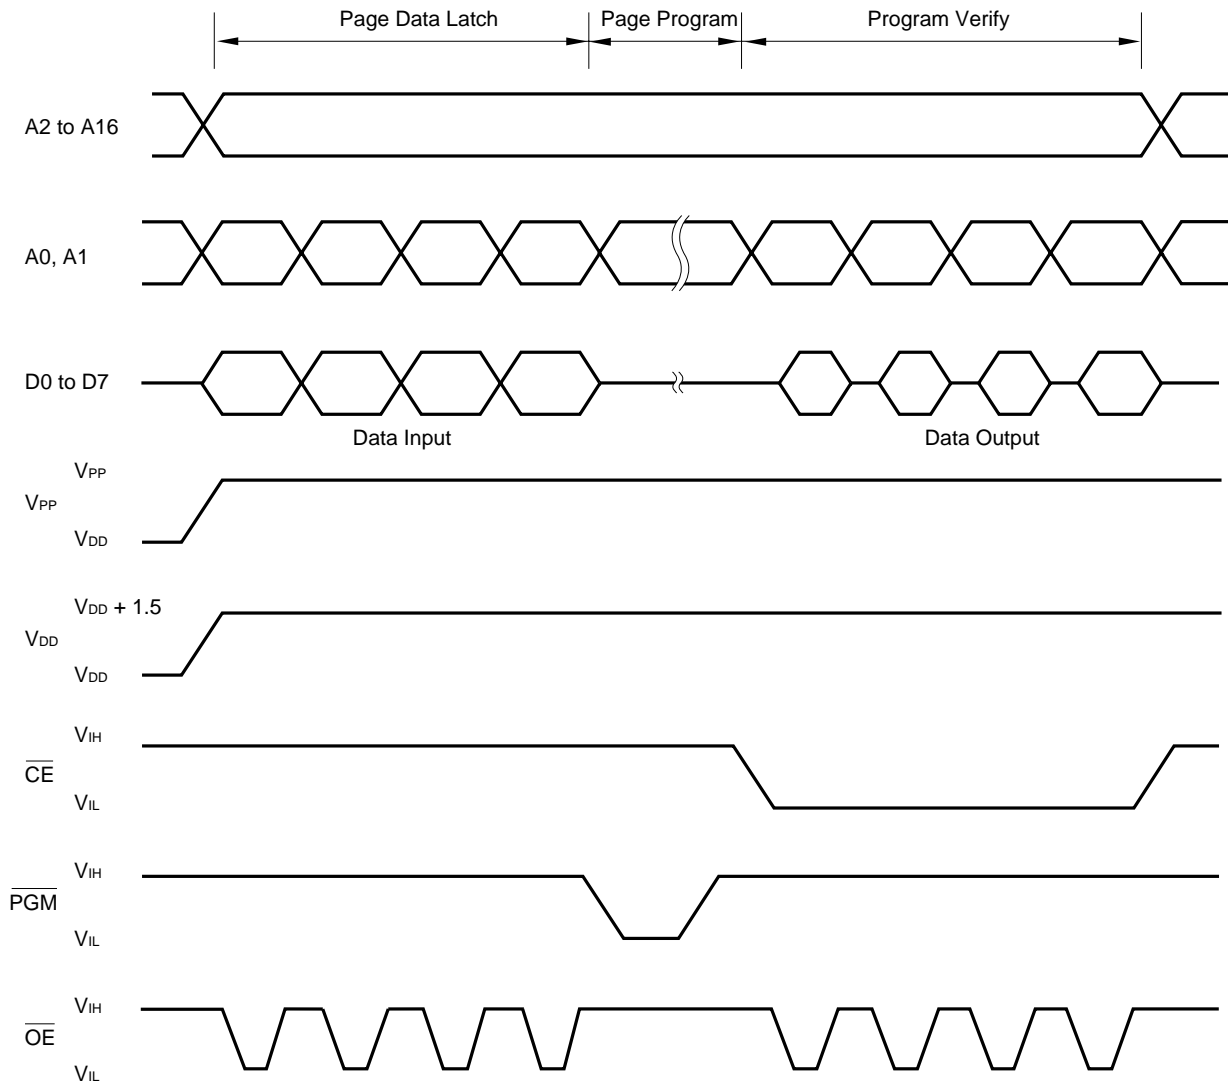

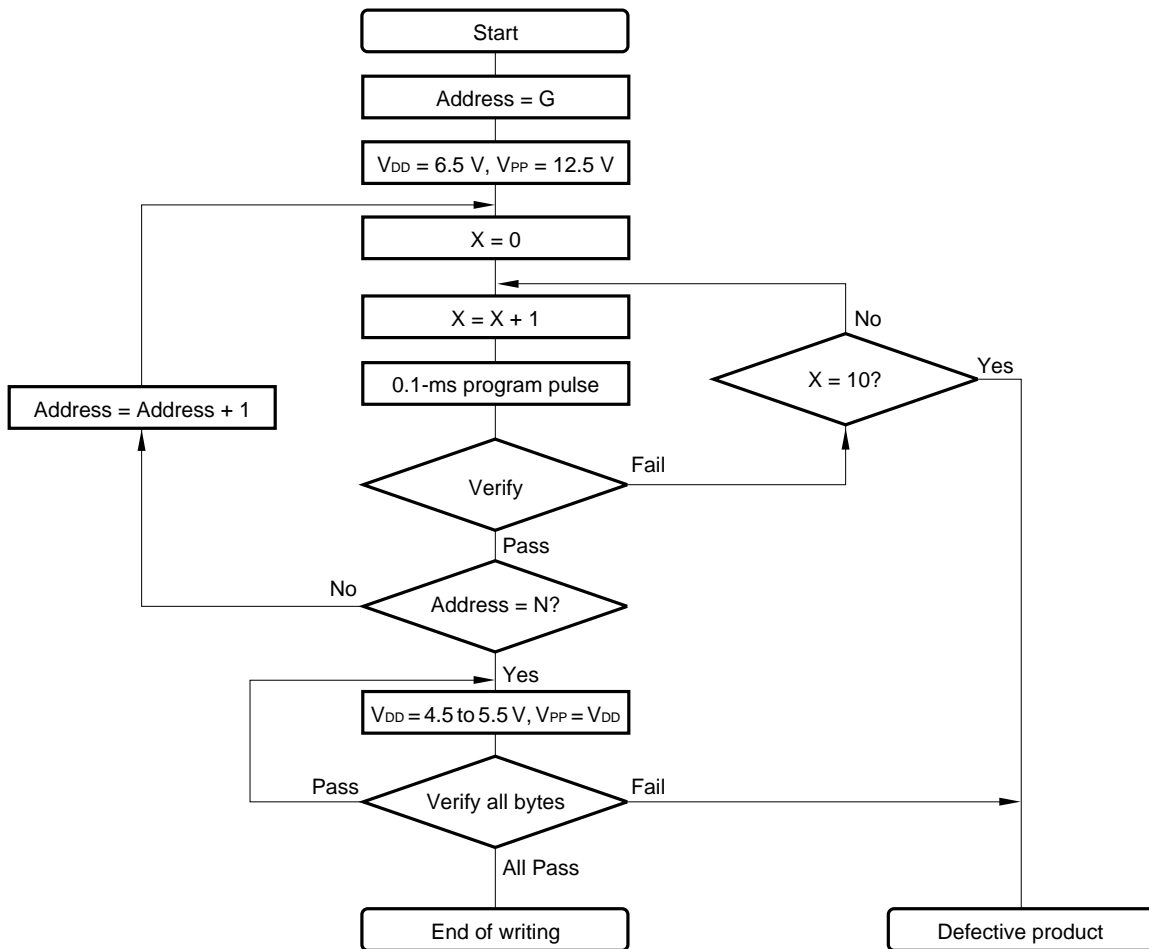

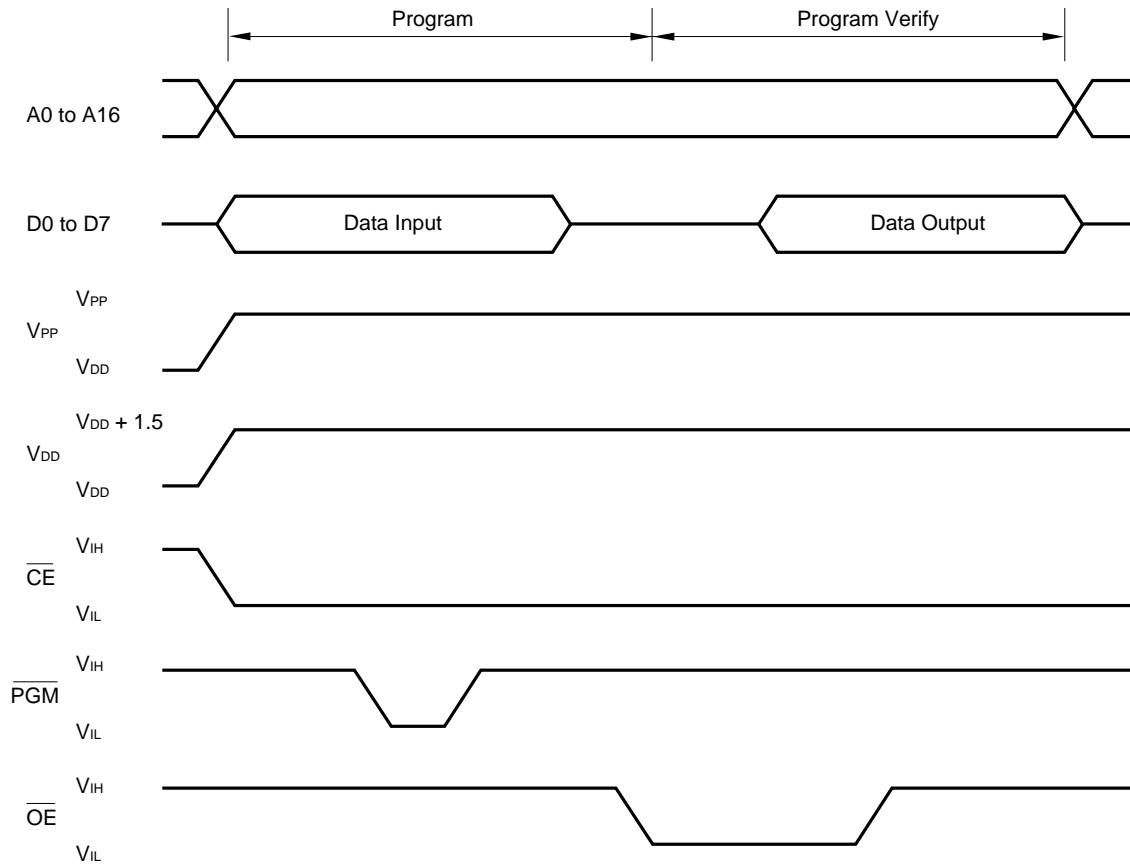

Figure 5-3. Byte Program Mode Flowchart

Remark G = Start address

- Cautions**
1. V_{DD} should be applied before V_{PP}, and removed after V_{PP}.
 2. V_{PP} must not exceed +13.5 V including overshoot.
 3. Reliability may be adversely affected if removal/reinsertion is performed while +12.5 V is being applied to V_{PP}.

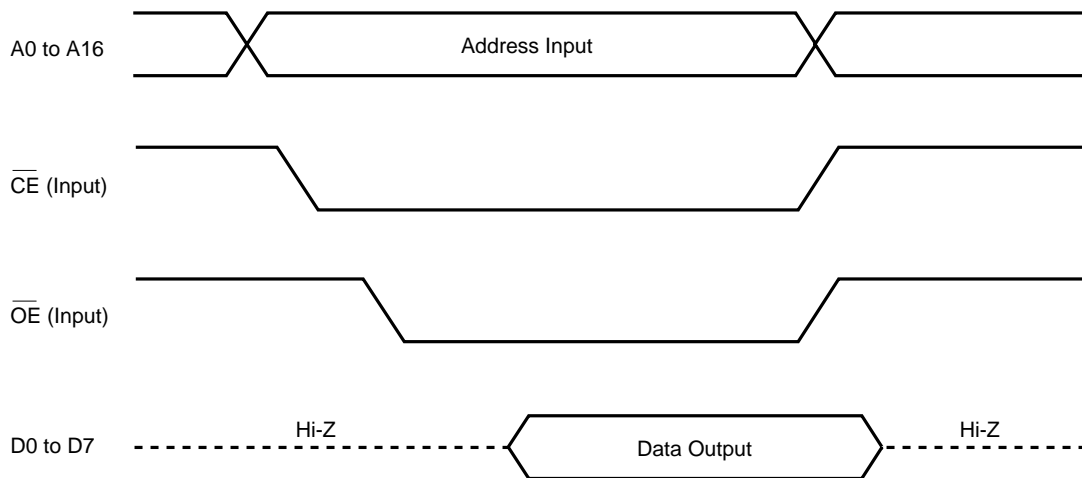

5.3 PROM Read Procedure

The contents of PROM are readable to the external data bus (D0 to D7) according to the read procedure shown below.

- (1) Fix the $\overline{\text{RESET}}$ pin at low level, supply +5 V to the V_{PP} pin, and connect all other unused pins as shown in **PIN CONFIGURATIONS (Top View) (2) PROM programming mode.**
- (2) Supply +5 V to the V_{DD} and V_{PP} pins.
- (3) Input address of read data into the A0 to A16 pins.
- (4) Read mode
- (5) Output data to D0 to D7 pins.

The timings of the above steps (2) to (5) are shown in Figure 5-5.

Figure 5-5. PROM Read Timings

6. SCREENING OF ONE-TIME PROM VERSIONS

The one-time PROM version (μ PD78P058FYGC-3B9, 78P058FYGC-8BT) cannot be tested completely by NEC before it is shipped, because of its structure. It is recommended to perform screening to verify PROM after writing necessary data and performing high-temperature storage under the conditions below.

Storage Temperature	Storage Time
125°C	24 hours

NEC offers for a fee one-time PROM writing, marking, screening and verify services for products designated as "QTOP Microcontrollers". For details, contact an NEC sales representative.

Caution Product quality may suffer if the absolute maximum rating is exceeded for even a single parameter, even momentarily. In other words, the absolute maximum ratings are rated values at which the product is on the verge of suffering physical damage, and therefore the product must be used under conditions which ensure that the absolute maximum ratings are not exceeded.

Remark Unless specified otherwise, alternate-function pin characteristics are the same as port pin characteristics.

Main System Clock Oscillator Characteristics (T_A = -40 to +85°C, V_{DD} = 2.7 to 6.0 V)

External clock		X1 input frequency (f _x) ^{Note 1}		1.0		5.0	MHz
		X1 input high-/low-level width (t _{xH} /t _{xL})			85		500

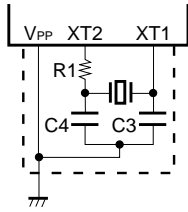

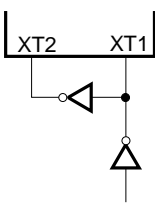

- Notes**
1. Only the oscillator characteristics are shown. See the AC characteristics for instruction execution times.
 2. This is the time required for oscillation to stabilize after a reset or STOP mode release.

Cautions

1. When the main system clock oscillator is used, the following should be noted concerning wiring in the area in the figure enclosed by broken lines to prevent the influence of wiring capacitance, etc.

- The wiring should be kept as short as possible.
 - No other signal lines should be crossed.
 - Keep away from lines carrying a high fluctuating current.
 - The oscillator capacitor grounding point should always be at the same potential as V_{SS}.
 - Do not connect to a ground pattern carrying a high current.
 - A signal should not be taken from the oscillator.
2. When the main system clock is stopped and the device is operating on the subsystem clock, wait until the oscillation stabilization time has been secured by the program before switching back to the main system clock.

Subsystem Clock Oscillator Characteristics (T_A = -40 to +85°C, V_{DD} = 2.7 to 6.0 V)

Resonator	Recommended Circuit	Parameter	Test Conditions	MIN.	TYP.	MAX.	Unit
Crystal resonator		Oscillation frequency (f _{XT}) ^{Note 1}		32	32.768	35	kHz
		Oscillation stabilization time ^{Note 2}	V _{DD} = 4.5 to 6.0 V		1.2	2	s
External clock		XT1 input frequency (f _{XT}) ^{Note 1}		32		100	kHz
		XT1 input high-/low-level width (t _{XTH} /t _{XTL})		5		15	μs

- Notes**
1. Only the oscillator characteristics are shown. See the AC characteristics for instruction execution times.
 2. This is the time required for oscillation to stabilize after power (V_{DD}) is turned on.

Cautions

1. When the subsystem clock oscillator is used, the following should be noted concerning wiring in the area in the figure enclosed by broken lines to prevent the influence of wiring capacitance, etc.

- The wiring should be kept as short as possible.
- No other signal lines should be crossed.
- Keep away from lines carrying a high fluctuating current.
- The oscillator capacitor grounding point should always be at the same potential as V_{SS}.
- Do not connect to a ground pattern carrying a high current.
- A signal should not be taken from the oscillator.

2. The subsystem clock oscillator is a low-amplitude circuit in order to achieve a low consumption current, and is more prone to misoperation due to noise than the main system clock oscillator. Particular care is therefore required with the wiring method when the subsystem clock is used.

PROM Write Mode Timing (page program mode)

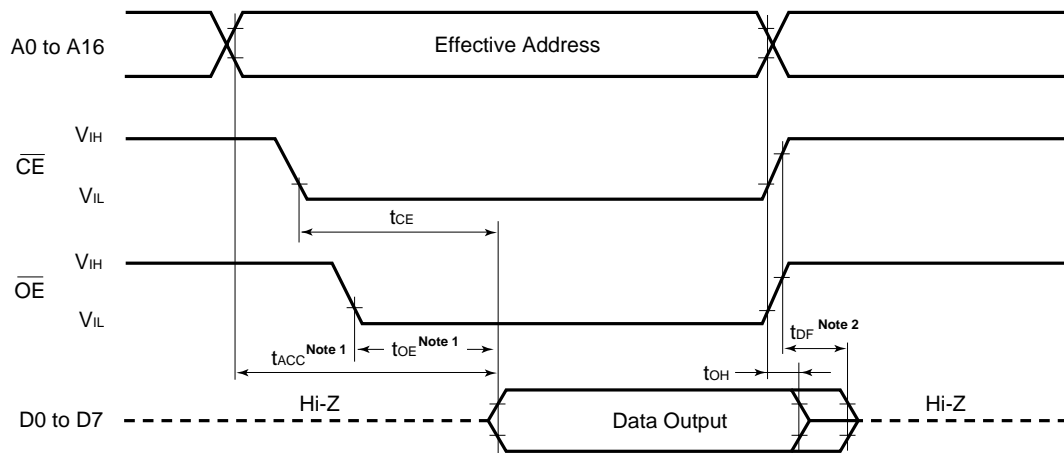

PROM Write Mode Timing (byte program mode)

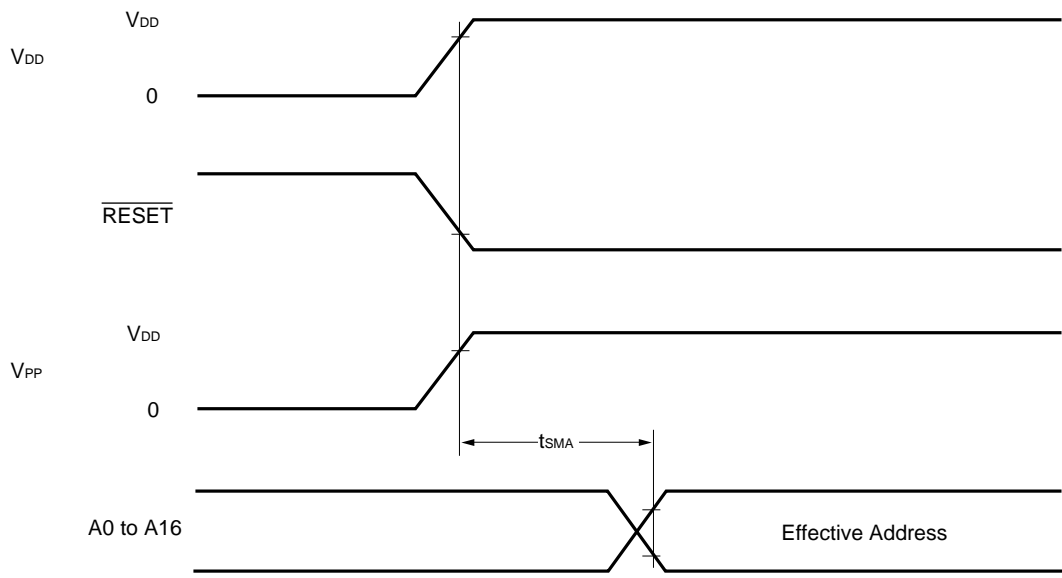

- Cautions**
1. V_{DD} should be applied before V_{PP}, and removed after V_{PP}.
 2. V_{PP} must not exceed +13.5 V including overshoot.
 3. Reliability may be adversely affected if removal/reinsertion is performed while +12.5 V is being applied to V_{PP}.

PROM Read Mode Timing

- Notes**
1. If you want to read within the t_{ACC} range, make the OE input delay time from the fall of CE a maximum of $t_{ACC} - t_{OE}$.
 2. t_{DF} is the time from when either OE or CE first reaches V_{IH}.

9. RECOMMENDED SOLDERING CONDITIONS

The μPD78P058FY should be soldered and mounted under the conditions recommended below.

For details of recommended soldering conditions, refer to the information document **Semiconductor Device Mounting Technology Manual (C10535E)**.

For soldering methods and conditions other than those recommended, please contact your NEC sales representative.

Table 9-1. Surface Mount Type Soldering Conditions

μPD78P058FYGC-3B9 : 80-pin plastic QFP (14 × 14 mm, Resin thickness: 2.7 mm)

Soldering Method	Soldering Conditions	Symbol
Infrared reflow	Package peak temperature: 235°C, Reflow time: 30 seconds or below (210°C or higher), Number of reflow processes: 3 max., Exposure limit: 7 days ^{Note} (after that, prebaking is necessary at 125°C for 20 hours)	IR35-207-3
VPS	Package peak temperature: 215°C, Reflow time: 40 seconds or below (200°C or higher), Number of reflow processes: 3 max., Exposure limit: 7 days ^{Note} (after that, prebaking is necessary at 125°C for 20 hours)	VP15-207-3
Wave soldering	Solder temperature: 260°C or below, Flow time: 10 seconds or below, Number of flow processes: 1, Preheating temperature: 120°C or below (package surface temperature), Exposure limit: 7 days ^{Note} (after that, prebaking is necessary at 125°C for 20 hours)	WS60-207-1
Pin partial heating	Pin temperature: 300°C or below, Time: 3 seconds or below (per side of device)	—

Note The number of days for storage after the dry pack has been opened. Storage conditions are 25°C and 65% RH max.

Cautions 1. Use of more than one soldering method should be avoided (except the pin partial heating method).

2. The μPD78P058FYGC-8BT being under development, soldering conditions have not been fixed.

APPENDIX A. DEVELOPMENT TOOLS

The following support tools are available for system development using the μPD78P058FY.

Language Processing Software

RA78K/0 ^{Notes 1, 2, 3, 4}	78K/0 Series common assembler package
CC78K/0 ^{Notes 1, 2, 3, 4}	78K/0 Series common C compiler package

NOTES FOR CMOS DEVICES

① PRECAUTION AGAINST ESD FOR SEMICONDUCTORS

Note: Strong electric field, when exposed to a MOS device, can cause destruction of the gate oxide and ultimately degrade the device operation. Steps must be taken to stop generation of static electricity as much as possible, and quickly dissipate it once, when it has occurred. Environmental control must be adequate. When it is dry, humidifier should be used. It is recommended to avoid using insulators that easily build static electricity. Semiconductor devices must be stored and transported in an anti-static container, static shielding bag or conductive material. All test and measurement tools including work bench and floor should be grounded. The operator should be grounded using wrist strap. Semiconductor devices must not be touched with bare hands. Similar precautions need to be taken for PW boards with semiconductor devices on it.

② HANDLING OF UNUSED INPUT PINS FOR CMOS

Note: No connection for CMOS device inputs can be cause of malfunction. If no connection is provided to the input pins, it is possible that an internal input level may be generated due to noise, etc., hence causing malfunction. CMOS device behave differently than Bipolar or NMOS devices. Input levels of CMOS devices must be fixed high or low by using a pull-up or pull-down circuitry. Each unused pin should be connected to V_{DD} or GND with a resistor, if it is considered to have a possibility of being an output pin. All handling related to the unused pins must be judged device by device and related specifications governing the devices.

③ STATUS BEFORE INITIALIZATION OF MOS DEVICES

Note: Power-on does not necessarily define initial status of MOS device. Production process of MOS does not define the initial operation status of the device. Immediately after the power source is turned ON, the devices with reset function have not yet been initialized. Hence, power-on does not guarantee out-pin levels, I/O settings or contents of registers. Device is not initialized until the reset signal is received. Reset operation must be executed immediately after power-on for devices having reset function.

Regional Information

Some information contained in this document may vary from country to country. Before using any NEC product in your application, please contact the NEC office in your country to obtain a list of authorized representatives and distributors. They will verify:

- Device availability
- Ordering information
- Product release schedule
- Availability of related technical literature
- Development environment specifications (for example, specifications for third-party tools and components, host computers, power plugs, AC supply voltages, and so forth)
- Network requirements

In addition, trademarks, registered trademarks, export restrictions, and other legal issues may also vary from country to country.

No part of this document may be copied or reproduced in any form or by any means without the prior written consent of NEC Corporation. NEC Corporation assumes no responsibility for any errors which may appear in this document.

NEC Corporation does not assume any liability for infringement of patents, copyrights or other intellectual property rights of third parties by or arising from use of a device described herein or any other liability arising from use of such device. No license, either express, implied or otherwise, is granted under any patents, copyrights or other intellectual property rights of NEC Corporation or others.

While NEC Corporation has been making continuous effort to enhance the reliability of its semiconductor devices, the possibility of defects cannot be eliminated entirely. To minimize risks of damage or injury to persons or property arising from a defect in an NEC semiconductor device, customers must incorporate sufficient safety measures in its design, such as redundancy, fire-containment, and anti-failure features.

NEC devices are classified into the following three quality grades:

"Standard", "Special", and "Specific". The Specific quality grade applies only to devices developed based on a customer designated "quality assurance program" for a specific application. The recommended applications of a device depend on its quality grade, as indicated below. Customers must check the quality grade of each device before using it in a particular application.

Standard: Computers, office equipment, communications equipment, test and measurement equipment, audio and visual equipment, home electronic appliances, machine tools, personal electronic equipment and industrial robots

Special: Transportation equipment (automobiles, trains, ships, etc.), traffic control systems, anti-disaster systems, anti-crime systems, safety equipment and medical equipment (not specifically designed for life support)

Specific: Aircrafts, aerospace equipment, submersible repeaters, nuclear reactor control systems, life support systems or medical equipment for life support, etc.

The quality grade of NEC devices is "Standard" unless otherwise specified in NEC's Data Sheets or Data Books. If customers intend to use NEC devices for applications other than those specified for Standard quality grade, they should contact an NEC sales representative in advance.

Anti-radioactive design is not implemented in this product.
